### Important Notice

- Due to the nature of wireless communications, transmission and reception of data can never be guaranteed. Data may be delayed, corrupted (i.e., have errors), or be totally lost. Significant delays or losses of data are rare when wireless devices such as the RAY are used in an appropriate manner within a well-constructed network. RAY should not be used in situations where failure to transmit or receive data could result in damage of any kind to the user or any other party, including but not limited to personal injury, death, or loss of property. RACOM accepts no liability for damages of any kind resulting from delays or errors in data transmitted or received using RAY, or for the failure of RAY to transmit or receive such data.
- Under no circumstances is RACOM or any other company or person responsible for incidental, accidental or related damage arising as a result of the use of this product. RACOM does not provide the user with any form of guarantee containing assurance of the suitability and applicability for its application.
- RACOM products are not developed, designed or tested for use in applications which may directly affect health and/or life functions of humans or animals, nor to be a component of similarly important systems, and RACOM does not provide any guarantee when company products are used in such applications.

## Quick Start Guide

- The default addresses of the RAY unit are 192.168.169.169/24 and 192.168.169.170/24.
- On your PC set up a similar address with the same mask, e.g. 192.168.169.180/24.
  - To configure your PC's address in Windows XP do the following: *Start – Settings – Network Connections*:  
*Change properties of this connection – Internet Network Protocol (TCP/IP) – Properties – Use the following IP address* – input 192.168.169.180 and use the mask 255.255.255.0. Click OK twice.
- Connect both RAY units to a PoE source and connect to a PC via PoE for configuration, see Fig. Link Configuration.
- Input the address of the connected RAY unit into the address field of your internet browser (such as Mozilla Firefox), e.g. 192.168.169.169. Login as *admin* with password *admin*.
- *Status* menu provides information on connection.
- *Settings – Radio* menu enables you to change the parameters of the radio and ethernet channel, *Settings – Service Access – Users* menu lets you change login parameters.
- Continue as suggested by the Step-by-step Guide.

# 1. RAY – Microwave Link

RAY Microwave link RAY is designed as high-speed point-to-point wireless bridge for data transmission under the latest requirements of modern wireless transmission equipment. It is built on a platform with a modern component base.

Ray works with ethernet interface and can be used in backhaul networks as well as a last-mile terminal. The design of microwave link RAY reflects effort on meeting the strictest criteria ETSI standards, particularly for durability against interference, high receiver sensitivity and high output power to achieve maximum link distance. Native gigabit Ethernet interface is able to cope with full speed user data throughput at low latency. High availability of the link (up to 99.999%) is able to be achieved with using hitless Adaptive coding and modulation.

The link properties can be summarised as:

- High data throughput
- Spectrum efficiency
- Robustness
- Security - configuration via http, https, ssh
- User friendly interface, advanced diagnostics

## Key technical features

Frequency range	RAY11-A	10.70 – 10.96 GHz	Lower	11.20 – 11.45 GHz	Upper
	RAY11-B	10.96 – 11.20 GHz	Lower	11.45 – 11.70 GHz	Upper
	RAY11-C	10.5005 – 10.5425 GHz	Lower	10.5915 – 10.6335 GHz	Upper
	RAY11-D	10.5425 – 10.5845 GHz	Lower	10.6335 – 10.6755 GHz	Upper
	RAY17	17.10 – 17.30 GHz			
	RAY24	24.00 – 24.25 GHz			
Modulation	QPSK, 16, 32, 64, 128, 256 QAM			fixed or ACM	
Channel spacing	1.75, 3.5, 7, 14, 28, 30, 40, 56 MHz				
User data rate	user data rate up to 359 Mbps				
Forward Error Correction	LDPC				
User interface	1 Gb Eth (10,100,1000), (IEEE 802.3ac 1000BASE-T)				
Optional service interface	100 Mbps (IEEE 802.3u 100BASE-TX)				
Power supply PoE	40–60 VDC, IEEE 802.3at up to 100 m				
Mechanical design	FOD (full outdoor)				
Security	configuration via https, ssh				

## Standards

Radio parameters	RAY11	ETSI EN 302 217-2-2 V1.3.1
	RAY17	ETSI EN 300 440-2 V 1.4.1
	RAY24	ETSI EN 300 440-2 V 1.4.1
EMC		ETSI EN 301 489-1 V1.8.1 (2008-04), ETSI EN 301 489 -17 V1.3.2 (2008-04)
Electrical safety		EN 60 950-1: 2004

### Note

Operation of the RAY11, RAY17 and RAY24 is described in this user manual.  
Operation of the RAY10 is described in the RAY10 User manual <sup>1</sup>.

<sup>1</sup> <http://www.racom.eu/eng/products/m/ray/index.html>

## 2. Implementation Notes

### 2.1. Link calculation

Before a microwave link can be installed, an analysis and calculation of the microwave link must be made first. The analysis should take place before the site survey itself to get a clear idea about the dimensions of the antennas. The analysis consists of the following steps:

- Free space loss calculation
- Link budget calculation
- Rain attenuation
- Multipath fading
- Fade margin
- Fresnel zones calculation

This chapter explains the individual steps and an example of link design is given at the end.

#### 2.1.1. Free space loss calculation

As the electromagnetic waves travel through open space they are attenuated. This attenuation is described as Free-space Loss. This loss depends on the distance travelled by signal and its frequency. Longer distance means greater attenuation and higher frequency means greater attenuation. Free-space loss can be calculated thus:

$$FSL = 32.44 + 20\log f + 20\log D$$

Where:

$FSL$  free-space loss (dB)

$f$  frequency of the emitted signal (MHz)

$D$  length of the link (km)

#### 2.1.2. Link budget calculation

To goal is to design a link so that the received signal is stronger than the receiver's sensitivity at the required BER (typically  $10^{-6}$ ). Since every radio signal in earth atmosphere is subject to fading, some difference between received signal level under normal circumstances and receiver sensitivity is needed to serve as a fade margin. The minimum value of fade margin can be calculated from the requirement for link availability (e.g. 99.999% of the time). The required margin depends on the length of the link as well as other factors such as rain attenuation, diffraction and multipath propagation.

If we ignore the additional loss along the path, the received signal strenght can be calculated using the formula for signal propagation in free space as follows:

$$P_R = P_T + G_T + G_R - FSL$$

Where

$P_R$  received power level (dBm)

$P_T$  transmitted power (dBm)

$G_T$  transmitting antenna gain (dBi)

$G_R$  receiving antenna gain (dBi)

$FSL$  free space loss (dB)

$P_R$  must be:

$$P_R > P_S$$

Where:

$P_S$  receiver sensitivity (dBm)

The receiver's sensitivity defines the minimum level of the received signal at which the receiver is able to process the received signal without losses or affecting the transmitted data (for BER better than  $10^{-6}$ ).

### 2.1.3. Fade margin

Determining sufficient fade margin is the most important step in microwave link design. If the margin is too small, the link will be unstable – as a result, sufficient availability of the link or quality of the provided services cannot be guaranteed. On the other hand, unnecessarily large margin makes the link more expensive (higher performance, larger and more expensive antennas) and increases the cost of creating the microwave link.

The following paragraphs describe the two most significant types of attenuation – rain and multipath attenuation, which are the most frequent along with free space loss. Mutual relation between rain and multipath attenuation rules out the possibility that the link could be affected by both types of attenuation at the same time – **these types of attenuation do not add up**. To determine the fade margin it is necessary to calculate both rain and multipath attenuation. The larger of the two types of attenuation determines the value of fade margin. In areas with high precipitation, rain attenuation can be expected to be more prominent. By contrast, links located in drier climates and little inclination, will suffer more from multipath attenuation.

### 2.1.4. Rain attenuation

FSL is not the only attenuation that influences the emitted signal. For frequencies of about 10 GHz rain attenuation starts to become increasingly effective. Precipitation is not identical in all areas which is why ITU released a recommendation Rec. ITU-R PN.837-1 for splitting the world into 15 regions according to precipitation intensity see Fig. 2.1, for more detail Appendix B, *Rain Zone Map*. In the areas with higher precipitation greater rain attenuation must be expected and a greater signal fade margin must be established, see the calculation of link availability.

The following properties are inherent to rain attenuation:

- It increases exponentially with rain intensity
- It becomes significantly larger as the distance travelled increases (>10 Km)
- Horizontal polarization causes greater rain attenuation than vertical polarization
- Rain outage increases dramatically with frequency and path length

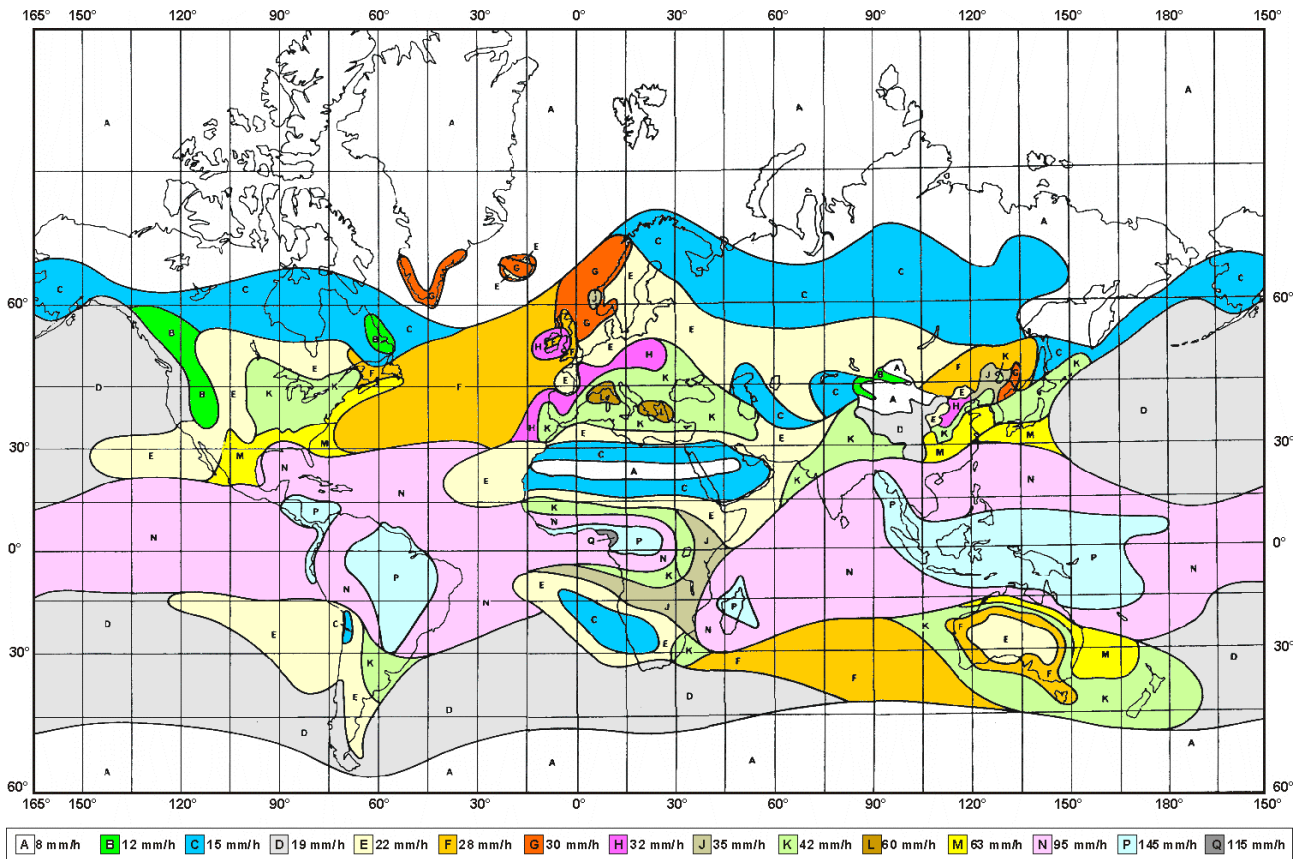

Fig. 2.1: Rain zone map, based on Rec.ITU-R PN.837-1

Rain attenuation can be calculated using ITU-R outage model, which consists of the following:

Obtain the rain rate  $R_{0.01}$  exceeded for 0.01 per cent of the time (with an integration time of 1 min).  $R_{0.01}$  values are defined for 15 rain zones and different time percentages and they are given in ITU-R Recommendation P.837.

Tab. 2.1: Rain rate R (mm/h) ITU-R P.837

Percentage of time (%)	A	B	C	D	E	F	G	H	J	K	L	M	N	P	Q
1.0	<0.1	0.5	0.7	2.1	0.6	1.7	3	2	8	15	2	4	5	12	14
0.3	0.8	2	2.8	4.5	2.4	4.5	7	4	13	42	7	11	15	34	49
0.1	2	3	5	8	6	8	12	10	20	12	15	22	35	65	72
0.03	5	6	9	13	12	15	20	18	28	23	33	40	65	105	96
0.01	8	12	15	19	22	28	30	32	35	42	60	63	95	145	115
0.003	14	21	26	29	41	54	45	55	45	70	105	95	140	200	142
0.001	22	32	42	42	70	78	65	83	55	100	150	120	180	250	170

Compute specific attenuation  $\gamma_R$  (dB/km) for the frequency, polarization, specific rain rate using ITU-R recommendation P.838. Rain attenuation for rain rate  $\gamma_{R_{0.01}}$  can be calculated as follows:

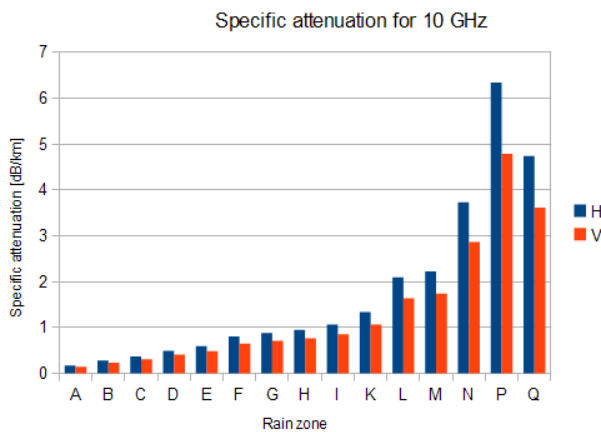

$$\gamma_{R_{0.01}} = k_{h,v} \cdot R_{0.01}^{\alpha_{h,v}}$$

where:

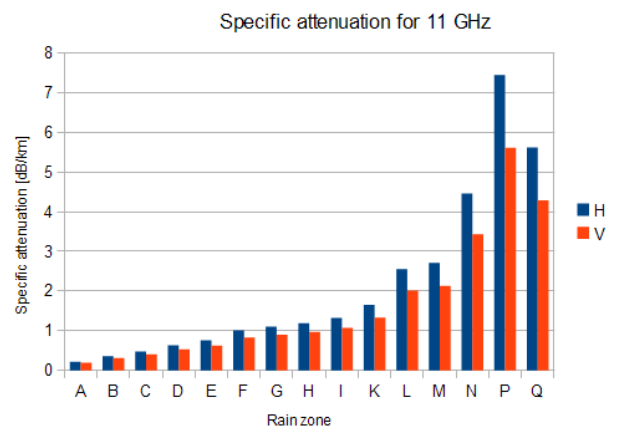

$k_{h,v}$ ,  $\alpha_{h,v}$  constants for horizontal and vertical polarization. Constants are slightly different for each polarization, see next table according to ITU-R P.838

**Tab. 2.2: Constants  $k$ ,  $\alpha$  for horizontal and vertical polarization at 10, 11, 17 and 24 GHz**

	$k_h$	$\alpha_h$	$k_v$	$\alpha_v$
10 GHz	0.01	1.26	0.01	1.22
11 GHz	0.02	1.21	0.02	1.16
17 GHz	0.06	1.09	0.07	1.01
24 GHz	0.14	1.01	0.14	0.96

*Fig. 2.2: Attenuation for 10 GHz, polarization H, V*

*Fig. 2.3: Attenuation for 11 GHz, polarization H, V*

*Fig. 2.4: Attenuation for 17 GHz, polarization H, V*

*Fig. 2.5: Attenuation for 24 GHz, polarization H, V*

Fig. 2.2 shows that rain attenuation is greater for horizontal polarization. In regions with higher precipitation the difference in attenuation is more marked. The microwave links RAY17 and RAY24 uses both polarizations, hence the need to consider worse of the two, i.e. horizontal polarization. When ACM is

active we recommend using horizontal polarization on the direction with lower data traffic (typically up-link).

### 2.1.5. Multipath fading

Multipath fading is another dominant fading mechanism. A reflected wave causes a phenomenon known as multipath, meaning that the radio signal can travel multiple paths to reach the receiver. Typically, multipath occurs when a reflected wave reaches the receiver at the same time in opposite phase as the direct wave that travels in a straight line from the transmitter.

Multipath propagation gives rise to two kinds of signal degrading effects, i.e., flat fading and frequency selective fading. Flat fading is a reduction in input signal level where all frequencies in the channel of interest are equally affected and is dependent on path length, frequency, and path inclination. In addition, it is strongly dependent on the geoclimatic factor  $K$ .

To calculate the probability of outage due to multipath propagation of microwave links ITU-R probability model can be used which describes a single frequency (or narrowband) fading distribution suitable for large fade depths  $A$  in the average worst month in any part of the world (based on ITU-R P.530-14) and for detailed link design is given as follows [1]:

$$P_0 = Kd^{3.4}(1+|\varepsilon_P|)^{-1.03}f^{0.8} \times 10^{0.00067h_L - A/10}$$

where:

$d$  link distance (km)

$f$  frequency (GHz)

$h_L$  altitude of lower antenna (m)

$A$  fade depth (dB)

$K$  is geoclimatic factor and can be obtained from:

$$K = 10^{-4.6 - 0.0027dN1}$$

The term  $dN1$  is provided on a  $1.5^\circ$  grid in latitude and longitude in ITU-R Recommendation P.453. The data are available in a tabular format and are available from the Radiocommunication Bureau (BR). E.g. in Central Europe the values  $dN1$  range from -242 to -362.

From the antenna heights  $h_e$  and  $h_r$  (meters above sea level), calculate the magnitude of the path inclination  $|\varepsilon_P|$  (mrad) using the following expression:

$$|\varepsilon_P| = \frac{|h_r - h_e|}{d}$$

where:

$d$  link distance (km)

$h_r, h_e$  antenna heights above sea level (m)

### 2.1.6. Fresnel zones calculation

The position of obstacles between points of the bridge can significantly influence the quality of the microwave link. The radio signal doesn't only radiate along the line of sight, but also in the area around it, i.e. in the so-called 1st Fresnel zone. Within this zone 90 % of the energy is transmitted between the transmitter and receiver antenna. This space has the shape of an ellipsoid. If it is disturbed the link has worse transmission properties and a higher quality antenna is required. For this reason the position of the antenna can be just as important as its height above ground. 60 % of the 1st Fresnel zone is considered as the most important.

Fig. 2.6: Fresnel zone

The general equation for calculating the first Fresnel zone radius at any point P in between the endpoints of the link is the following:

$$F_1 = \sqrt{\lambda \frac{d_1 \cdot d_2}{d_1 + d_2}}$$

Where:

$F_1$  first Fresnel Zone radius in metres

$d_1$  distance of P from one end in metres

$d_2$  The distance of P from the other end in metres

$\lambda$  wavelength of the transmitted signal in metres

The cross sectional radius of each Fresnel zone is the highest in the center of link, shrinking to a point at the antenna on each end. For practical applications, it is often useful to know the maximum radius of the first Fresnel zone. From the above formula calculation of the first Fresnel zone can be simplified to:

$$r = 8,657 \sqrt{\frac{D}{f}}$$

where:

$r$  max radius of first Fresnel zone (m)

reducing the radius to 60% get values listed in the following table that define the space particularly sensitive to the presence of obstacles

$D$  total link distance (km)

$f$  frequency (GHz)

**Tab. 2.3: 60 % of the 1st Fresnel zone**

Length of link $D$	Radius of zone $r$ for frequency		
	11 GHz	17 GHz	24 GHz
0,5 km	1.10 m	0.89 m	0.75 m
1 km	1.56 m	1.25 m	1.06 m
2 km	2.21 m	1.77 m	1.50 m
4 km	3.13 m	2.50 m	2.12 m
6 km	3.84 m	3.07 m	2.60 m
8 km	4.43 m	3.54 m	3.00 m
10 km	4.95 m	3.96 m	3.35 m
15 km	6.06 m	4.85 m	4.10 m
20 km	7.00 m	5.60 m	4.74 m
50 km	11.07 m		

## 2.2. Example of microwave link design

*Fig. 2.7: Design flowchart*

Link parameters:

- Link distance: 4 km
- First antenna height above sea level: 295 m
- Second antenna height above sea level: 320 m
- Location: Central Europe (rain zone H, refraction gradient  $dN1 = -300$ )

Transmission requirements:

- Required data rate: >160 Mbps
- Required availability: 99.99 %

RAY parameters:

- 17 GHz

- 161 Mbps -> Modulation 16QAM; BW=56 MHz;  $P_S(\text{BER } 10^{-6}) = -79 \text{ dBm}$
- Tx power +5 dBm (max. Tx power)
- Antenna gain:
  - 30 cm ... 32.2 dBi
  - 60 cm ... 37.8 dBi
  - 99 cm ... 42 dBi

### Step 1 - Free space loss calculation

$$FSL = 32.44 + 20\log f + 20\log D = 32.44 + 20\log 17.2 \cdot 10^3 + 20\log 4 = 129.1 \text{ dB}$$

### Step 2 - Rain attenuation

For 99.99% availability in rain zone B the rain rate is  $R_{0.01}=32$  (see Fig. 2.1)

For  $f=17 \text{ GHz}$   $k_h=0.06146$ ;  $\alpha_h=1.0949$ ;  $k_v=0.06797$ ;  $\alpha_v=1.0137$

Vertical polarization:

$$Y_{R0.01} = k_v \cdot R_{0.01}^{\alpha_v} = 0.07 \cdot 32^{1.01} = 2.32 \text{ dB/km} \Rightarrow \text{for 4km distance 9.3 dB}$$

Horizontal polarization:

$$Y_{R0.01} = k_h \cdot R_{0.01}^{\alpha_h} = 0.06 \cdot 32^{1.09} = 2.62 \text{ dB/km} \Rightarrow \text{for 4km distance 10.5 dB}$$

### Step 3 - Attenuation due to multipath propagation

We have to find required fade margin for reliability of the link 99.99 percent.

Path inclination:

$$|\varepsilon_P| = \frac{|h_r - h_e|}{d} = \frac{|295 - 320|}{4} = 6,25 \text{ mrad}$$

The percentage of time that fade depth A (dB) is exceeded in the average worst month is calculated as:

$$P_0 = Kd^{3.4}(1+|\varepsilon_P|)^{-1.03}f^{0.8} \times 10^{0.00067h_L - A/10}$$

$$P_0 = 10^{-4.6 - 0.0027 \times (-300)} \times 4^{3.4} (1+|6.25|)^{-1.03} 17.2^{0.8} \times 10^{0.032 \times 10 - 0.00067 \times 295 - A/10}$$

$$P_0 = 0.022871 \times 10^{-0.19765 - A/10}$$

For reliability 99.99% is  $P_0=0.01$  we get exponential function for A:

$$A = -0.19765 - 10\log(0.01/0.022871) = 3.4 \text{ dB}$$

The minimum fade margin required to suppress multipath fading on this link would be 4 dB.

### Step 4 - Link budget calculation

Calculation in steps 2 and 3 determines the minimum fade margin required for stable link operation as 11 dB (rain attenuation is dominant). If you use the maximum performance of antenna with diameter of 30 cm, complete the radio formula as follows:

$$P_R = P_T + G_T + G_R - FSL = 5 + 32.2 + 32.2 - 129.1 = -59.7 \text{ dB}$$

Fade margin:

$$A = |P_S| - |P_R| = 79 - 59.7 = 19.3 \text{ dB}$$

The resulting fade margin is larger than the required 11 dB. Current legislation in the Czech Republic allows maximum EIRP of +20, i.e. the sum of transmit power and antenna gain at the transmitter can be 20 dB at the most. For 99cm antennas, TX power can be up to  $20 - 42 = -22 \text{ dB}$ , the resultant equation is as follows:

$$P_R = P_T + G_T + G_R - FSL = -22 + 42 + 42 - 129.1 = -67.1 \text{ dB}$$

Fade margin:

$$A = |P_S| - |P_R| = 79 - 67.1 = 11.9 \text{ dB}$$

Fade margin is now only 12 dB which corresponds to link availability > 99.99% of the time in a year. Technical literature often gives the minimum fade margin of 20 dB. For very long links (more than 10 km) fade margin will, indeed, be approximately 20 dB. For shorter links, however, such large margin is not necessary. It is helpful to first conduct the calculation above to receive an idea of the attenuation affecting the link.

### The result

To achieve the required transmission capacity and link availability for link distance of 4 km, transmit power -22 dBm and 99 cm antennas were selected for both sides of the link.

### 3. Product

The RAY microwave links are designed for data transmissions in both licensed and unlicensed ISM bands. They work as a point-to-point link in full duplex regime with transfer speed up to 360 Mbps. Bandwidth is selectable from 1.75 up to 56 MHz. Modulation can be fixed or adaptive and can be adjusted from QPSK to 256QAM.

*Fig. 3.1: RAY – Microwave link*

The link is formed by two FOD (Full Outdoor) stations. In the case of links operating in the ISM bands (RAY17, RAY24), both stations have identical hardware. In the case of links operating in the licensed bands, one unit is transmitting in the Lower and receiving in the Upper part of the band. The other unit is operating vice versa.

RAY links are used with external parabolic antennas. Parabolic antennas from different producers are available.

**Cross polarization** - valid only for links operating in the ISM bands (RAY17, RAY24):

One side of the link uses one polarization for transmission (e.g. horizontal) and the opposite polarity for receiving (e.g. vertical). The other side of the link is turned by 90°. It therefore transmits and receives using opposite polarizations with respect to the other side.

### 3.1. Range of models

RAy11-LA	frequency 10.70 – 10.96 GHz, unit L
RAy11-LB	frequency 10.96 – 11.20 GHz, unit L
RAy11-LC	frequency 10.5005 – 10.5425 GHz, unit L
RAy11-LD	frequency 10.5425 – 10.5845 GHz, unit L
RAy11-UA	frequency 11.20 – 11.45 GHz, unit U
RAy11-UB	frequency 11.45 – 11.70 GHz, unit U
RAy11-UC	frequency 10.5915 – 10.6335 GHz, unit U
RAy11-UD	frequency 10.6335 – 10.6755 GHz, unit U
RAy17	universal unit for 17.10 – 17.30 GHz band
RAy24	universal unit for 24.00 – 24.25 GHz band

Every model can be supplied in two different versions:

- with one metal Ethernet port, e.g. RAY17
- with two metal Ethernet ports, e.g. RAY17-2

For details see Section 3.6, “Ordering codes”

A detailed table of frequencies can be found in Chapter 9, *Technical parameters*.

### 3.2. Installation

The antenna is attached to the mast using a holder adjustable in two planes. The RAY unit is then mounted on the antenna. There are two possible mounting positions – for horizontal and vertical polarization. Installation and adjustment of the holder is described in Chapter Antenna mounting.

Fig. 3.2: RAY Microwave link – antenna and FOD unit

LAN connection is possible using one or two connectors:

- The RAYXX version uses a single connector for user data, service access and PoE

- The RAYXX-2 version uses two connectors, one for user data and PoE power supply and one for service access. For assembly of connectors see chapter Connectors.

The third BNC connector serves for connecting voltmeter for RSS indication during the antenna adjustment process.

*Fig. 3.3: RAY Microwave link – connectors*

### 3.3. Status LEDs

Fig. 3.4: Status LEDs

Tab. 3.1: Meaning of LED status indicators

Diode	Colour	Function
ETH	Green	User port Flashing slowly: Auto Negotiation in progress Flashing rapidly: Link Activity 10/100/1000 Permanently lit: Link 10/100/1000
	Yellow	Management port Flashing: Link Activity 10/100 Permanently lit: Link 10/100
SYS	Green	Permanently lit: System OK Flashing rapidly: Booting Flashing slowly: Operating system in service mode
	Red	Permanently lit: Station is performing defaults. Firmware writing in progress. DO NOT POWER OFF. Flashing slowly: Serious system error.
AIR	Green	Permanently lit: AIR link OK
	Red	Permanently lit: AIR LOSS, loss of connectivity

### 3.4. Technical parameters

Basic technical parameters are stated in Chapter 9, *Technical parameters*

## 3.5. Dimensions

### Communication unit ODU

- Outer size • 245 x 245 x 150 mm
- Weight • RAY11 — 2.8 kg  
• RAY17 — 2.5 kg  
• RAY24 — 2.5 kg

### Diameters of supplied antennas

RAY units are ready for direct mounting to Jirous<sup>1</sup> Class 2 antennas. Individual datasheets are accessible here<sup>2</sup>.

- 10, 11 GHz:
  - 38 cm, 29.0 dBi
  - 65 cm, 35.5 dBi
  - 90 cm, 37.5 dBi
- 17 GHz:
  - 40 cm, 34.8 dBi
  - 68 cm, 38.6 dBi
  - 90 cm, 41.0 dBi
  - 120 cm, 43.7 dBi
- 24 GHz:
  - 40 cm, 36.8 dBi
  - 68 cm, 41.7 dBi

Andrew (Class 2 or 3) or Arkivator antennas are also possible to be used with antenna mounting kit. Flexible waveguide is a general-purpose option for any antenna usage.

### Name plate

The plate contains name, bar code record, CE label, etc.:

- Type – RAY product line identification
- Code – detailed identification of the station type (see annex for details Section 3.6, “Ordering codes”)
- S/N – serial number, link contains stations with two different numbers
- MAC – HW address of user ethernet port

<sup>1</sup> <http://en.jirous.com/>

<sup>2</sup> [http://www.racom.eu/eng/products/microwave-link.html#accessories\\_jirous](http://www.racom.eu/eng/products/microwave-link.html#accessories_jirous)

## 3.6. Ordering codes

### 3.6.1. Microwave units

The proper pair of Lower and Upper units should be selected when ordering the microwave link. This is not true for ISM bands units (RAY17, RAY24). In such a case the same unit is used for both sides of the link.

**Note** - The Lower and Upper unit has to be selected from the same sub-band (i.e. from the same row of the table).

The RAY10 ordering codes are stated here for clarity. The RAY10 User manual can be found here<sup>3</sup>.

Type	Licenced bands				ISM bands	
	10 GHz		11 GHz		17 GHz	24 GHz
Frequency range	A	10.30 – 10.59 GHz	A,B	10.70 – 11.70 GHz	17.10 – 17.30 GHz	24.00 – 24.25 GHz
	B	10.15 – 10.65 GHz	C,D	10.50 – 10.68 GHz		

Sub-bands	Lower [GHz]	Upper [GHz]	Lower [GHz]	Upper [GHz]	no sub-bands	no sub-bands
A ordering code	10.30-10.42 <b>RAY10-LA</b>	10.47-10.59 <b>RAY10-UA</b>	10.70-10.96 <b>RAY11-LA</b>	11.20-11.45 <b>RAY11-UA</b>	<b>RAY17</b>	<b>RAY24</b>
B ordering code	10.15-10.30 <b>RAY10-LB</b>	10.50-10.65 <b>RAY10-UB</b>	10.96-11.20 <b>RAY11-LB</b>	11.45-11.70 <b>RAY11-UB</b>		
C ordering code			10.5005-10.5425 <b>RAY11-LC</b>	10.5915-10.6335 <b>RAY11-UC</b>		
D ordering code			10.5425-10.5845 <b>RAY11-LD</b>	10.6335-10.6755 <b>RAY11-UD</b>		

ver. 3.1

In case of the two-port units, the "-2" label shall be connected to the end of the ordering code. Example:

- **RAY11-LA-2**
- **RAY17-2**

### 3.6.2. Feature keys

The Feature keys ordering code consists of three parts:

XXX-YYY-ZZZ

XXX - Product type, e.g. "RAY11".

YYY - Feature key type.

The "SW" key is available now. This key unlocks the User speed to given value.

ZZZ - Feature key value. In case of User speed it states Mbps. Example:

- **RAY11-SW-100** ... RAY11 user data speed max. 100 Mbps.
- **RAY17-SW-360** ... RAY17 user data speed max. 360 Mbps.

<sup>3</sup> <http://www.racom.eu/eng/products/m/ray/index.html>

### 3.7. Accessories

The microwave bridge comes supplied as standard with:

- two FOD units
- two antenna dishes with brackets for mounting on a mast – based on the user requirements and specifications
- tub of NOVATO silicon lubricant (mixture of silicon grease, PTFE and other additives) for lubricating the antenna pin. (see Section 5.2.3, “Lubrication and preservation of the antenna pivot”)

**Microwave bridge accessories** need to be ordered separately, for further details please see [www.racom.eu](http://www.racom.eu)<sup>4</sup>

- Two pieces of parabolic antennas with mast holder - according to user needs and specifications. The antenna from two different vendors are available currently (year 2013). The overview of different antenna types is listed in paragraph Dimensions. The antenna choice determines radio link properties. The radio link calculation should be performed to determine proper antenna size. Rough calculation can be done using simple on-line calculator.<sup>5</sup>  
The other antenna producers can be used with RAY links as well. The RAY unit can be attached to the antenna by flexible waveguide or directly by means of special interconnection part. There are several types of those parts for Andrew and Arkivator antennas. It is possible to develop the interconnection part also for other antenna types.
- FOD unit power supplies – 30W PoE adapters
- two connectors (plastic IE-PS-V01P-RJ45-FH or metallic IE-PS-V01M-RJ45-FH) for connecting the FOD unit for outdoor use – these quality connectors allow the connection of cables with conductors of cross-sectional area 0.129–0.329 mm<sup>2</sup> (AWG 26 – AWG 22, i.e. ø0.4–ø0.64 mm). For assembly instructions see chapter Section 5.3.2, “Fitting an external IE-PS-V01P-RJ45-FH connector”
- two IE-PS-RJ45-BK connectors for connecting the FOD unit for indoor use.
- S/FTP Cat.7 cable for connecting FOD units to the network.
- AGC cable for connecting a voltmeter to the RAY unit for adjusting the antenna direction. (see g - "Antenna mounting", point g)
- Grounding set for grounding the CAT7 cable. Manufactured by PEWTRONIC s.r.o., code S/FTP 4+2
- RAY grounding set for grounding RAY equipment to the mast. Contains a ZSA16 grounding terminal, grounding tape and a cable with grounding lugs.

Grounding set for grounding the CAT7 cable, RAY grounding set – see images Fig. 5.63 - "Grounding kit for S/FTP 4+2 cable" and Fig. 5.65 - "RAY grounding kit".

**Additional microwave bridge accessories** which have been specially selected for installation of RAY microwave bridges can also be ordered :

<sup>4</sup> <http://www.racom.eu/eng/products/microwave-link.html#accessories>

<sup>5</sup> <http://www.racom.eu/eng/products/microwave-link.html#calculation>

- Set of tools for installation of the bracket and mounting of connectors in the **RAy Tool** set. Branded tools which allow complete installation of the microwave bridge.

*Fig. 3.5: RAY Tool set*

## 4. Step-by-step Guide

The following chapters will guide you step by step through preparation, installation and activation of the RAY link:

- Pre-installation check out
- Installation
- Advanced configuration
- Troubleshooting

### Pre-installation Checklist

Familiarise yourself with the controls and prepare your configuration ahead of the installation of the link on the mast tube.

Both units (without antennas) can lie on a desk with flanges running parallel and facing up at an angle, on a non-metal desk they can also face downward. In the case of units operating in the ISM band (RAY17, RAY24), turn unit holder so that they are roughly perpendicular to each other. In the case of units operating in licensed bands (RAY10, RAY11), turn unit holders so that they are roughly parallel to each other. Use an ethernet cable to connect each of the units to a PoE source and connect a PC to one of them for configuration.

Take the following steps to establish a connection between the PC and RAY and perform a basic setup.

Fig. 4.1: Link Configuration

**Warning**

During operation, never bring waveguides of both stations close to each other. There is a risk of damaging sensitive input circuits.

**4.1. Service access**

RAY link is supplied with a default configuration of access parameters:

Unit L has the service IP address 192.168.169.169 and mask 255.255.255.0, Unit U has the service IP address 192.168.169.170 and mask 255.255.255.0, access is allowed over HTTP, HTTPS or SSH, the username is *admin* and the password is also *admin*.

On your PC setup an IP address that is within the mask, i.e. 192.168.169.180.

Then open the https configuration interface, e.g. `https://192.168.169.169`

Other access options are described in the chapter *Settings – Service Access* of this manual.

When connection has been established, use the *Settings – Service access – Services* menu to customise access parameters. Default IP addresses should be replaced with well-chosen operating addresses. Leaving default addresses in place can lead to network problems later.

The menu contains parameters for the entire link, both for the Local and remote Peer units. If a connection has been established, both sets of parameters have been set. While working with an isolated unit, only Local parameters are functional for the currently connected unit.

**Note**

If link is **OK** and there are no parameters shown of the station **Peer**, it is necessary to click on **Refresh**.

Follows the description of basic settings. After entering values on the screen always save the content by clicking on **Apply**.

**Note**

If there is any problem with https certificate after completing the firmware upgrade, please see the Annex Appendix E, *Https certificate* for further steps.

### 4.1.1. Menu Settings – General

- Station name – station can be assigned with a name, e.g. the place of installation.
- Station location – for easier inclusion the network hierarchy, it is possible to enter the station’s location

The screenshot displays the 'General' settings page for a station configuration. At the top, a red header bar shows 'Local: Location\_A / 12:43', 'Link: Ok', and 'Peer: Location\_B / 12:43'. On the left, a sidebar menu includes 'Status', 'Settings' (with 'General' selected), 'Radio', 'Ethernet', 'QoS', 'Service access', 'Alarm limits', 'Diagnostics', 'Tools', and 'Help'. The main content area is titled 'General' and is organized into two columns: 'Local' and 'Peer'. The 'Local' column shows 'Unit code: RAY17', 'Serial no.: 28282', 'Station name: Location\_A', 'Station location: Rokytno', 'LED indicators: [checked]', 'Date: 2013-04-19', 'Time: 12:43:42', 'Time source: manual', 'Adjust time: [button]', 'NTP source IP: 0.0.0.0', 'NTP period: 1 m', 'Time zone: (GMT) Greenwich Mean Time', and 'Daylight saving: off'. The 'Peer' column shows 'Unit code: RAY17', 'Serial no.: 80808', 'Station name: Location\_B', 'Station location: Pohledec', 'LED indicators: [checked]', 'Date: 2013-04-19', 'Time: 12:43:39', 'Time source: manual', 'NTP source IP: 0.0.0.0', 'NTP period: 1 m', 'Time zone: (GMT) Greenwich Mean Time', and 'Daylight saving: off'.

	Local	Peer
Unit code	RAY17	RAY17
Serial no.	28282	80808
Station name	Location_A	Location_B
Station location	Rokytno	Pohledec
LED indicators	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Date	2013-04-19	2013-04-19
Time	12:43:42	12:43:39
Time source	manual	manual
Adjust time	[Adjust time]	
NTP source IP	0.0.0.0	0.0.0.0
NTP period	1 m	1 m
Time zone	(GMT) Greenwich Mean Time	(GMT) Greenwich Mean Time
Daylight saving	off	off

Fig. 4.2: Configuration Menu Settings - General

### 4.1.2. Menu Settings – Service access – Services

- IPv4 address – enter a valid IP address to access the drive. The default IP address has to be replaced with a valid address. Keeping the default address will probably lead to future problems in the network.
- Netmask – enter the network mask.
- Gateway – if necessary, enter a gateway, otherwise leave blank
- Enable access protocols that you are going to need. For security reasons, do not enable more than what is necessary.
- HTTP(S) – allow access to the web interface.
- Telnet – enabling access to the CLI interface using telnet protocol.
- SSH – enabling access to the CLI interface using SSH protocol.
- Management VLAN – Enabling 802.1Q VLAN tag for separation of user and service operations.
- Management VLAN id – Defining 802.1Q VLAN tag for service operations.

Status		Local: Location_A / 09:33		Link: Ok		Peer: Location_B / 09:32	
<b>Settings</b>

Fig. 4.3: Configuration menu Settings – Service access – Services

### 4.1.3. Menu Settings – Service access – Users

- *Edit* - enter the menu.
- *New password* – choose a password and enter it.
- *Confirm password* – enter the password again to confirm.

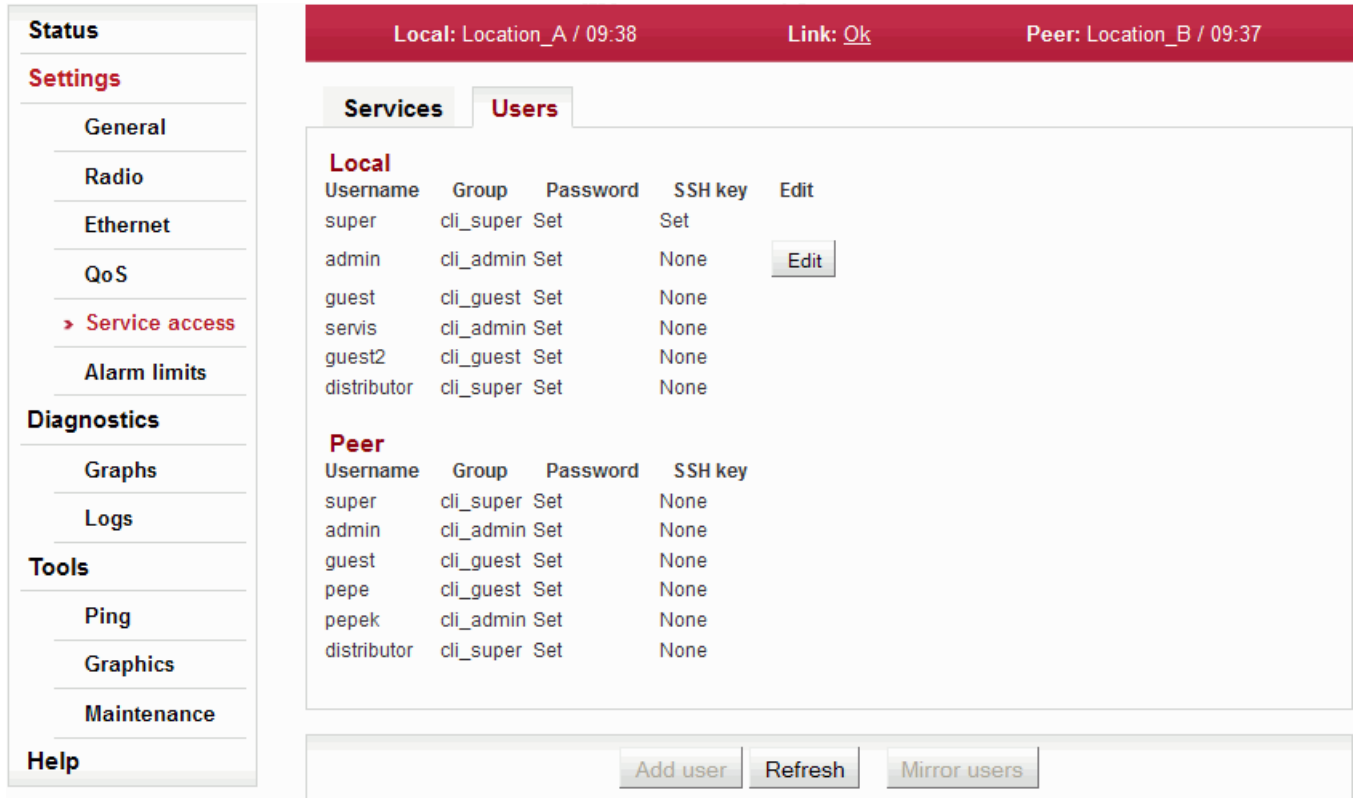

Fig. 4.4: Configuration menu Settings – Service access – Services

### 4.1.4. Menu Maintenance – Feature keys

Firmware of the microwave link is capable of limiting the maximum user data speed. The Feature key to unlock specific user data speed should be installed prior to unit physical installation. The microwave link can be operated only at the lowest speed (according to link type down to 5 Mbps) without the installed Feature key. For further details see Feature keys.

## 4.2. Basic link configuration

Default radio parameters depend on the specific type of link and the specific channel allocation table. Channels are typically set in the lower part of the band, the smallest bandwidth, QPSK modulation, and low power. Both units in the pair should be capable of immediate communication. If it is possible to work with these radio parameters at the installation location, the link can be activated. On an operating link, required operating parameters can then be set up.

If a change in the parameters is necessary, it is done in the menu *Settings – Radio* and saved by clicking Apply. This applies when working on both units simultaneously if they are connected, otherwise each unit is configured individually. When configuring units individually, pay attention to correct settings of duplex pair for channels TX and RX. For example, if one station has TX channel L1, then the second station must also have the channel RX L1.

### 4.3. Link test

#### Verify the functionality of the radio link. Switch in screen Status - Brief:

- Status Bar displays *Link: Ok*.  
If the alarm message appears at Local or Peer, this doesn't necessarily mean there is a problem. The message indicates that the limit at any of the monitored parameters has been exceeded. Essential is the *Link: Ok* message.
- The *Status* screen contains values for both Local and Peer units. N/A next to Peer indicates that the data from the Peer unit has not been transferred. If *Link* is *Ok*, simply click Refresh at the bottom of the screen and Peer data will be updated.
- Menu *Status – Detailed – Radio* indicates link RSS and SNR values, in case of ACM also the selected modulation and Netbitrate. If the ATPC function is enabled (menu *Settings – Radio*) it also indicates instantaneous / max. allowed power and for SNR and RSS values it indicates immediate / target value size.
- Menu *Tools – Graphics – Bar indicators* display current size of RSS, SNR and BER.
- Menu *Tools – Ping* allows you to send a ping test to the selected IP address.

#### Try out the possibility of modulation:

- Modulation ACM. In menu *Settings – Radio* enable ACM. Set the TX modulation parameter to the required maximum value. In menu *Status – Brief – Radio* you can monitor (Refresh or Start) changes in used modulation based on the instantaneous SNR signal quality. Status and quality of modulation is demonstrated well in menu *Tools – Graphics – RX constellation diagram*, hit Refresh.
- To set a fixed modulation go to *Settings - Radio*, switch off ACM and set the TX modulation to a value from the range of QPSK through 256-QAM based on the results of the previous test. If you choose modulation higher than allowed by SNR, the connection will be lost. *Status Link* will lose its *Ok* value. Both units will need to be moved closer to resume the link. If this is not possible, use ethernet to access each unit individually and set the basic modulation QPSK. You can monitor the quality of the received signal under *Tools – Graphics – RX constellation diagram*.

#### Verify the functionality of the entire link:

- If possible, connect user devices to both RAY units over PoE and test mutual communication.
- Another way of testing this is to connect a PC to the other unit and send a ping from one PC to the other.
- The minimum variant of this test is to use ethernet cable connection from the PC connected to the local RAY to the PC connected to the remote RAY and test communication between both units over ethernet. This will verify ethernet functionality.

#### Prepare installation configuration:

- Bandwidth e.g. 3.5 MHz. To get the highest possible receiver sensitivity, set the bandwidth as narrow as possible according to specific frequency band.
- TX channel: Use your allocated channel. If you don't have allocated channel yet, use for example channel L1.
- RX channel will setup automatically when channel lock activates.
- TX modulation QPSK to get the highest possible sensitivity.
- RF power according to selected antenna and according to individual frequency licence. Set the output power as high as possible.
- Record the access parameters from the Service access menu, especially the IP addresses.

- Restart by interrupting power supply to verify that the parameters are stored correctly and the link works.

After this preparation phase you can continue to install your devices in working environment.

## 5. Installation

### 5.1. Line of sight test

Before you install the device to a mast tube, verify visually that the view in direction of the remote unit is unobstructed. Watch out for these obstacles in particular:

- Free Fresnel zones. Signal needs space wider than the diameter of the antenna.
- Trees at the lower end of the Fresnel zone. They will be taller in a few years.
- Possible building development.
- Objects in the close proximity of the antenna such as edges of other antennas, their mounting racks, edges of the roof.

### 5.2. Antenna mounting

#### 5.2.1. Mounting methods

- according to the method of mounting on the mast tube
  - right-side mounting
  - left-side mounting
- according to the method of mounting the FOD unit – antenna polarization
  - horizontal mounting
  - vertical mounting

In both cases mount the unit with the connectors facing downwards at an angle.

*Fig. 5.1: Left-side mounting – horizontal polarization of receiving*

*Fig. 5.2: Left-side mounting – vertical RX polarization*

*Fig. 5.3: Right-side mounting – horizontal RX polarization*

### Changing the mounting method

Antenna bracket is supplied as standard partly assembled, and ready for right-side mounting.

On changing the **Jirous** antenna bracket for left-side mounting the adjustment bolt (part No. 11) and swivel bolt (part No. 12) need to be unscrewed, then shift the bracket body (part No.13) to the other side of clamp plate (part No. 4), (do not turn upside down) and then insert bolt (part No. 12) into the second hole on the mounting plate holder and through the same hole on the clamp plate and secure in place with the nuts. The adjustment bolt (item No. 11) and nuts (item No. 9) are switched to the other side of the clamp plate (part No. 4). It is also necessary to switch the hanging bolt (part No. 7) on the mounting plate (part No. 5) to the second hole so that after switching sides with the antenna it is on the top again.

On changing the **Arkivator** type antenna bracket for left-side mounting the adjustment pin (part No. 17) needs to be unscrewed and switched to the other side of the bracket body (part No.3) and clamp plate (part No. 4). It is also necessary to switch the adjustment bolt (part No. 21) and U-plate (part No. 13) to the other side of the bracket body (part No.3). This ensures that there is still good access to the adjustment elements for changing the direction of the antenna when mounted on this opposite side.

In the case of the antenna when changing the method of mounting from right-side to left-side it is only necessary to change the eye hook on the top and rotate the plastic cover of the antenna. This is not only important from an aesthetic point of view, so that the RACOM logo is not upside down, but also because there is a discharge channel on the lower edge of the dish (except for ø380 mm dishes).

When changing the polarization from horizontal to vertical only the FOD unit needs to be turned through 90° around the central antenna pin by unscrewing the four bolts on the dish using a No. 6 Allen key. (or on the reducing crossplate (part No. 7) for the Arkivator type antenna)

#### Important

The RAY17 and RAY24 links are equipped with a polarization duplexer and work in both polarizations simultaneously, see Cross polarization. One side of the link must therefore be installed in vertical polarization and the other in the horizontal polarization.

### 5.2.2. Mounting the FOD unit on the antenna

RAy microwave bridge equipment is generally supplied as several component parts packaged separately in a box.

- Two parabolic antennas.
- Two brackets for mounting the antenna to the mast.
- Two FOD stations, each separate in a box, in a single package.
- Other accessories based on the order placed (for more detailed information see chapter Section 3.7, "Accessories")

When ordering a RAY microwave bridge there is a choice of antennas from two manufacturers to be connected to the RACOM FOD unit.

#### Mounting the FOD unit on the Jirous antenna

A No. 17 spanner and a No. 6 Allen key are required for mounting the mechanical parts of the antenna. Spanner No. 17 serves for precisely setting the direction of the antenna. Both spanner and key can be found in the **RAY Tool** set for installing RAY microwave bridges.

Fig. 5.4: Close up image of the mounted bracket showing numbered parts

- a. Prepare the antenna bracket based on the diameter of the mast tube. For smaller diameters face the bent part of the saddle plate (part No. 3) inwards. For larger diameters it should face outwards. Screw the bolts (part No. 1) into the clamp plate (part No. 4) so that they protrude approx. 1 cm through the clamp plate. Clamp the saddle plate to the mast by tightening the nuts (part No. 2) on the bolts.

*Fig. 5.5: Position of the saddle plate for  $\varnothing$  40–80 mm*

*Fig. 5.6: Position of the saddle plate for  $\varnothing$  65–115 mm*

- b. Slide the antenna bracket onto the mast tube and clamp to the mast by tightening the nuts.

*Fig. 5.7: Attaching the bracket to the mast tube*

- c. The second part of the bracket – mounting plate (part No. 5), is screwed to the antenna dish with three bolts (part No. 6). Screw the eye hook into the upper threaded hole of the dish to ease handling of the dish during installation. The position of the eye hook on the dish and hanging bolts on the plate change according to the type of installation, see Section 5.2.1, “Mounting methods”.

*Fig. 5.8: Dish without mounting plate*

*Fig. 5.9: Dish with mounting plate*

- d. Screw the hanging bolt (part No. 7) into the upper hole of the mounting plate so that the antenna can be hung on the mounting plate holder. Hang the antenna on it and tighten the lower bolt. (part No. 8)

*Fig. 5.10: Hanging the bolt on the holder*

*Fig. 5.11: Correct position of the mounting plate*

- e. Tighten both bolts to the plate before continuing with installation to prevent any unnecessary movements of the whole equipment. Before precisely adjusting the vertical direction of the antenna upon completing installation it will be necessary to unscrew them again as the lower bolt passes through the adjustment block and the upper one serves as the axis of rotation.

*Fig. 5.12: Tightening the upper bolt to the mounting plate*

*Fig. 5.13: Tightening the lower bolt to the mounting plate*

- f. Before installing the FOD unit on the antenna first unscrew the 4 bolts on the back of the antenna enough so that the unit can be slid on to them. Then check whether the "O" ring is correctly fitted on the antenna pin, and make sure it is not damaged and has been lubricated with grease – see Section 5.2.3, "Lubrication and preservation of the antenna pivot". Then remove the protective plastic cover from the central pin of the antenna and fit the FOD unit to it carefully so as not to damage the "O" ring. Secure it in place with the four bolts. Carefully ensure the correct polarization of the antenna – see Section 5.2.1, "Mounting methods". Finally tighten the bolts with a No. 6 Allen key.

*Fig. 5.14: Dish before installing the FOD unit*

*Fig. 5.15: Tightening bolts on the FOD unit*

- g. The precise horizontal direction the antenna is pointing in can be adjusted using the bolt with two nuts (part No. 9). Once the direction has been set the antenna is fixed in place by tightening the nuts against the bracket to prevent further movement of the antenna. The vertical direction the antenna is pointing in can be adjusted by turning the fine adjustment bolt (part No. 10) by the bracket mounting plate. After selecting the correct direction the position is secured by tightening the bolt – see point e (part No. 7 and 8). The correct position in both directions is found by monitoring RSS – voltmeter, or with an audible alarm (if equipped) – see Section 5.5.2, “Antennas directing”.

*Fig. 5.16: Horizontal adjustment of the antenna direction*

*Fig. 5.17: Vertical adjustment of the antenna direction*

- h. After pointing the antenna in the right direction tighten the bolts on the bracket on the axes of rotation (part No. 11 and 12). Then check again that all other bolts have been sufficiently tightened. We can now proceed to connecting the FOD unit to the user network.

*Fig. 5.18: Tightening the axis at the fine adjustment bolt*

*Fig. 5.19: Tightening the axis at the bracket*

### Mounting the FOD unit on the Arkivator antenna

Installation of a RAY microwave bridge with an Arkivator type antenna is very similar to the installation described above, and is clear from the following images. The tools required for installation can be found in the **RAY Tool** kit for installation of RAY microwave bridges. No. 13, 16 and 17 spanners and No. 4 and 6 Allen keys are required for installation. For an antenna with a nominal diameter of 120 cm a No. 14/24 double open ended spanner, supplied with the antenna.

From 2013 Arkivator antenna is delivered with a slightly different bracket, see Fig. 5.24, "Arkivator antenna bracket, version 2013". Assembly process is similar.

Fig. 5.20: Installation diagram for the Arkivator antenna, 30 and 60 cm, version 2012

Fig. 5.21: Installation diagram for the Arkivator antenna, 99 cm, version 2012

The antenna bracket (part No. 3 and 4) is supplied assembled as per the following image. The bracket is installed on the mast tube in a similar way to that of the Jirous antenna (point a). The bracket is ready for tube diameters up to 115 mm. The bolts (part No. 6) should be screwed to the clamp plate (part No. 4) in such a way that the end of the bolt protrudes approx. 6-10 mm through the other side of the clamp plate. Saddle plates (part No. 5) are then clamped against the mast tube by tightening nuts (part No. 7).

### Warning

Before mounting the adapter (part No. 25) to be removed the green foil from the antenna (part No. 1). This film covers the transport of the center hole in the waveguide.

After mounting the bracket on the mast tube, bolt the bent plate (part No. 2, for Arkivator 30 and 60) or (part No. 30, for Arkivator 99) to the bracket. The actual antenna (part No. 1) is then bolted to this plate.

Fig. 5.22: Arkivator antenna bracket (2012) Fig. 5.23: Bracket on the mast, version 2012

A reducing adapter (part No. 25), a reducing crossplate (part No. 21) and sleeves (part No. 22) are used for mounting the FOD unit (part No. 20) on the antenna. During installation do not forget "O" rings (part No. 26 and 27) and to lubricate the "O" ring (part No. 27), see Section 5.2.3, "Lubrication and preservation of the antenna pivot".

Bolt (part No. 14) serves for accurately setting the vertical direction of the antenna. When setting the direction release bolt (part No. 12 and 13), and then tighten it again once you have the correct position. The nuts on bolt (part No. 10) serves for setting the horizontal direction. Once the direction is set these nuts (part No. 11), pivot bolt (part No. 9) in the hanging eye of bolt and two pivot bolts (part No. 8) where the tilt bracket is need to be tightened.

Fig. 5.24: Arkivator antenna bracket, version 2013

Fig. 5.25: Arkivator antenna bracket (2013)

Fig. 5.26: 30 and 60 cm diameter Arkivator antenna

Fig. 5.27: Installation diagram for the Arkivator antenna, 120 cm

### 5.2.3. Lubrication and preservation of the antenna pivot

Before fitting the FOD unit bush onto the antenna pivot ensure that the "O" ring (part No. 1) is in the correct position. It is also essential to prevent moisture getting in between these two parts. This moisture could cause oxidation which would complicate disassembly of this mechanical coupling in the future. For this reason we need to treat these surfaces with the lubricant grease which is supplied in the box marked RAY bridge accessories. If you use a different grease for lubrication then it should be a Teflon grease or a silicon lubricant grease.

*Fig. 5.28: Grease points on the antenna pivot and FOD unit bush*

Grease the internal area of the bush on the FOD unit (2) and the "O" ring (1) with a thin even layer that allows the pin to slide easily into the bush without damaging the "O" ring. Grease the area beyond the "O" ring on the antenna pin (3) with a thicker layer so that it fills the gap caused by the play between the pin and the bush (max. 0.1 mm/∅) thus preventing moisture getting in. Installation should be carried out according to the antenna installation description – see point f of this description.

## 5.3. Connectors

### 5.3.1. Connecting the FOD communication unit to the user network

The FOD communication unit is connected to the user network by an Ethernet cable via interfaces GbE, IEEE802.3ac 1000BASE-T. As standard, RACOM recommends using an S/FTP CAT 7 cable and two RJ45 connectors for outdoor installations. One for the internal (IE-PS-RJ45-FH-BK) and the second for the external (plastic IE-PS-V01P-RJ45-FH or metallic IE-PS-V01M-RJ45-FH) end of the cable.

Based on the PoE standard the station is powered over the Ethernet cable.

If the station is equipped with two connectors, the right one carries user data, and the left connector is to be used for servicing.

The middle BNC type connector serves for connecting a voltmeter for precisely setting direction.

Fig. 5.29: Connecting the FOD communication unit

#### Important

Before connecting the FOD communication unit to the supply (to the user network) the FOD unit must be grounded according to Section 5.4, "Grounding".

It is necessary to install the antenna lead so that there is no excessive mechanical stress applied on the Ethernet connector.

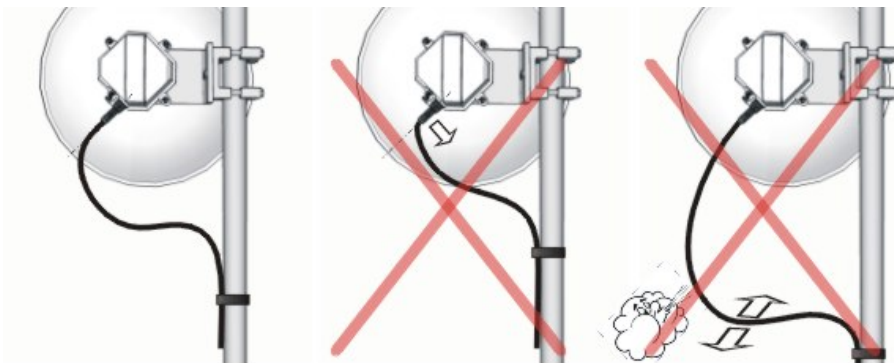

Fig. 5.30: Example of a correct lead installation.

### 5.3.2. Fitting an external IE-PS-V01P-RJ45-FH connector

We recommend using an S/FTP 4×(2×23AWG) Cat.7 + 2×(2×24 AWG) cable for connecting the FOD unit, as it is designed for external use. The cable contains two additional twisted pairs, 2x(2x24 AWG), which are not used. The following images show the internal cable without these additional pairs.

- a. Use the tools from the **RAy Tool** set for fitting connectors. See Section 3.7, “Accessories”.

Fig. 5.31: Tools for fitting connectors

Fig. 5.32: IE-PI-RJ45-FH connector before fitting

- b. Undo the nut on the connector cover and push it on to the cable. Then trim at least 20 mm of insulation from the end of the cable.

Fig. 5.33: Tool for removing insulation

Fig. 5.34: Insulation removed

- c. Twist the braid forming the cable shielding together and wrap around the cable so that 2-3 loops are next to each other at the end of the insulation.

Fig. 5.35: Twisted shielding

Fig. 5.36: Shielding wrapped around the cable

- d. Separate individual pairs of conductors, remove the aluminium shielding from them, cut it off, and separate individual conductors. Cut off the two additional twisted pairs from the thinner wire in the middle (not seen on these images).

Fig. 5.37: Trimming shielding

Fig. 5.38: Separated pairs of conductors

- e. Push the lower layer of conductors into the openings as per the pinout sticker (T568B) attached to the connector. Take care not to confuse white conductors from individual pairs.

Fig. 5.39: Pushing the lower pairs into the connector

Fig. 5.40: Lower pairs pushed in

- f. Then from above push the upper conductors into the connector according to the pinout sticker and trim them. The cable must be pushed in far enough so that the braided shielding is inside the metal part of the connector.

Fig. 5.41: Cutting off of the upper conductors

Fig. 5.42: All conductors in the connector

- g. Remove the pinout sticker and fit the complementary half of the connector. Squeeze the parts together until the locks snap into place. Use the pair of pliers with parallel jaws from the **RAy Tool** set for this. Standard pliers would damage the connector.

Fig. 5.43: Fitting the complementary half of the connector

Fig. 5.44: Squeezing the connector until the locks snap into place

- h. Then slide the protective cover onto the connector. It must fit into the grooves after snapping into place. Finally tighten the nut on the cover to seal the point where the cable enters the connector.

Fig. 5.45: Sliding the cover onto the connector

Fig. 5.46: Finished IE-PI-RJ45-FH connector

### 5.3.3. Fitting an internal IE-PS-RJ45-FH-BK connector

- a. Use the same tools as for fitting the external connector. The internal connector does not have a cover.

Fig. 5.47: IE-PS-RJ45-FH-BK connector before fitting

Fig. 5.48: Finished connector IE-PS-RJ45-FH-BK

- b. Trim at least 20 mm of insulation from the end of the cable.

*Fig. 5.49: Removing insulation*

*Fig. 5.50: Removed insulation*

- c. Twist the braid forming the cable shielding together and wrap around the cable so that 2-3 loops are next to each other at the end of the insulation. Separate individual pairs of conductors, remove the aluminium shielding from them, cut it off, and separate individual conductors. Cut off the two additional twisted pairs from the thinner wire in the middle (not seen on these images).

*Fig. 5.51: Twisted shielding*

*Fig. 5.52: Removing aluminium conductor shielding*

- d. Prepare individual pairs according to the pinout sticker attached to the connector (T568B) and unwind the two pairs for the bottom part of the connector. Take care not to confuse white conductors from individual pairs.

*Fig. 5.53: Separated pairs of conductors*

*Fig. 5.54: Lower two pairs ready for inserting*

- e. First insert the lower row of conductors from the back. Then unwind the others and insert them into the holes for the upper row of conductors, as per the pinout sticker. Ensure that the wrapped around shielding braid is inserted sufficiently to create a good contact with the second part of the connector fitted with sprung contacts. Snap the plastic clamp onto the cable. Squeeze it together tight enough so that it doesn't allow movement of the cable.

Fig. 5.55: Lower pairs pushed in

Fig. 5.56: All conductors in the connector

- f. Trim the overhanging conductors.

Fig. 5.57: Trimming conductors

Fig. 5.58: Inserted and trimmed conductors

- g. Remove the pinout sticker from the connector and slide on the mate. Clamp the whole connector together until the locks snap into place. Use a pair of pliers with flat heads from the **RAY Tool** set. Ordinary pliers could damage the connector.

Fig. 5.59: Fitting the mate to the internal connector

Fig. 5.60: Clamping the internal connector together with pliers

## 5.4. Grounding

The lightning and overvoltage protection system example, designed in accordance with regulation CSN EN 62305.

1. Where possible the antenna should be located in an LPZ 0B protection zone with the use of a local or artificial air termination device for protection against direct lightning strikes.
2. When meeting conditions for ensuring electrical insulation (distance from the lightning conductor) in accordance with article 6.3, it is not recommended to ground the load-bearing structure and antenna to the external air termination network. Ground should be connected to the protective system of the internal LV wiring or grounded internal structures using a CYA 6 mm<sup>2</sup> bonding conductor, see Fig. 5.61, "Grounding installation 1"
3. If it is not possible to set up conditions of electrical insulation in accordance with article 6.3 we recommend connecting the load-bearing structure at roof level to the external air termination network via an 8mm diameter FeZn conductor and shielding the data cable before entry to the building with a grounding kit and CYA 6 mm<sup>2</sup> conductor to the bonding bus, and if not already set up then also to the external air termination network, see Fig. 5.62, "Grounding installation 2"
4. If there is not an external LPS on the building we recommend routing lightning current through an 8mm FeZn conductor to a common grounding system, or to a separate grounding electrode with a ground resistance up to 10 Ω.
5. For limiting the overvoltage transferred over the data cable and into the building we recommend fitting surge protection at the interface between zones LPZ 0 and LPZ 1 connected via a CYA 4 mm<sup>2</sup> conductor to the same grounding point as the antenna or the antenna mast.
6. We recommend protecting the PoE power supply from overvoltage on the LV side with suitable class D surge protection.

Fig. 5.61: Grounding installation 1

Fig. 5.62: Grounding installation 2

The RAY unit is grounded to the flange by the Ethernet connector using an M6 screw. An insulated copper cable with a minimum diameter of 6 mm<sup>2</sup> terminated with a terminal lug is used as a protective

conductor. The conductor should have a green/yellow sheath across its whole length. For grounding a RAY grounding kit can be ordered as an accessory (see Section 3.7, “Accessories”) containing a grounding terminal ZSA16, 40 cm grounding strip 15 mm wide, and 100 cm of cable with grounding lugs. For instructions on installing terminals see the datasheet RAY grounding kit<sup>1</sup>. A qualified person must install the antenna.

Racom supplies surge protection for installation on Ethernet cables entering buildings. For more details see Surge protection<sup>2</sup>.

### Additional safety recommendations

- Only qualified personnel with authorisation to work at heights are entitled to install antennas on masts, roofs and walls of buildings.
- Do not install the antenna in the vicinity of electrical wiring. The antenna and bracket should not come into contact with electrical wiring at any time.
- The antenna and cables are electrical conductors. During installation electrostatic charges may build up which may lead to injury. During installation or repair work to parts of the antenna lead open metal parts must be temporarily grounded.
- The antenna and antenna cable must be grounded at all times. See Section 5.4, “Grounding”.
- Do not mount the antenna in windy or rainy conditions or during a storm, or if the area is covered with snow or ice.
- Do not touch the antenna, antenna brackets or conductors during a storm.

Fig. 5.63: Grounding kit for S/FTP 4+2 cable

Fig. 5.69: Separated lightning conductor

## 5.5. Start up

Connect a power supply to the installed FOD unit and connect the configuration PC. Use an internet browser (such as Mozilla Firefox) to enter the configuration menu.

### 5.5.1. Noise on the site

This chapter is particularly true for installation of links working in free bands, where the user has no secured frequency.

Analyse the level of noise in the individual channels using the spectrum analyzer under *Tools – Graphics – Frequency analyzer*. If necessary adjust the choice of working channel on the basis of the results.

While doing so respect the rule that in one location all units emit signal in the Upper part of the range and receive it in the Lower part of the range, or the other way round. A transmitter must not be installed in the part of the spectrum where other units function as receivers.

### 5.5.2. Antennas directing

If it is possible, use narrow channel, low modulation and high power for the first antenna directing. Working on both ends of the link simultaneously is favourable. Connect voltmeter to the BNC connector and observe RSS changes in 2 V DC range. Stronger signal corresponds to lower voltage. Alternate units on both sides and slowly adjust the antenna vertically and horizontally to find the position with

the strongest reception. At the same time look for the main signal maximums. To differentiate between the main and the side maximums refer to Main and side lobes paragraph.

### **RSS measurement**

For correctly setting the bridge and positioning it in the right direction it is advisable to connect a PC and use the diagnostic capabilities of the RAY station. In uncomplicated cases it is enough to connect a voltmeter via a BNC connector and adjust to the lowest indicated voltage. Voltage is calibrated according to signal strength. E.g.:

RSS -65 dBm corresponds to voltage 0.65 V,

RSS -80 dBm corresponds to voltage 0.80 V etc.

*Fig. 5.70: Connecting a voltmeter to the BNC connector.*

## Main and side lobes

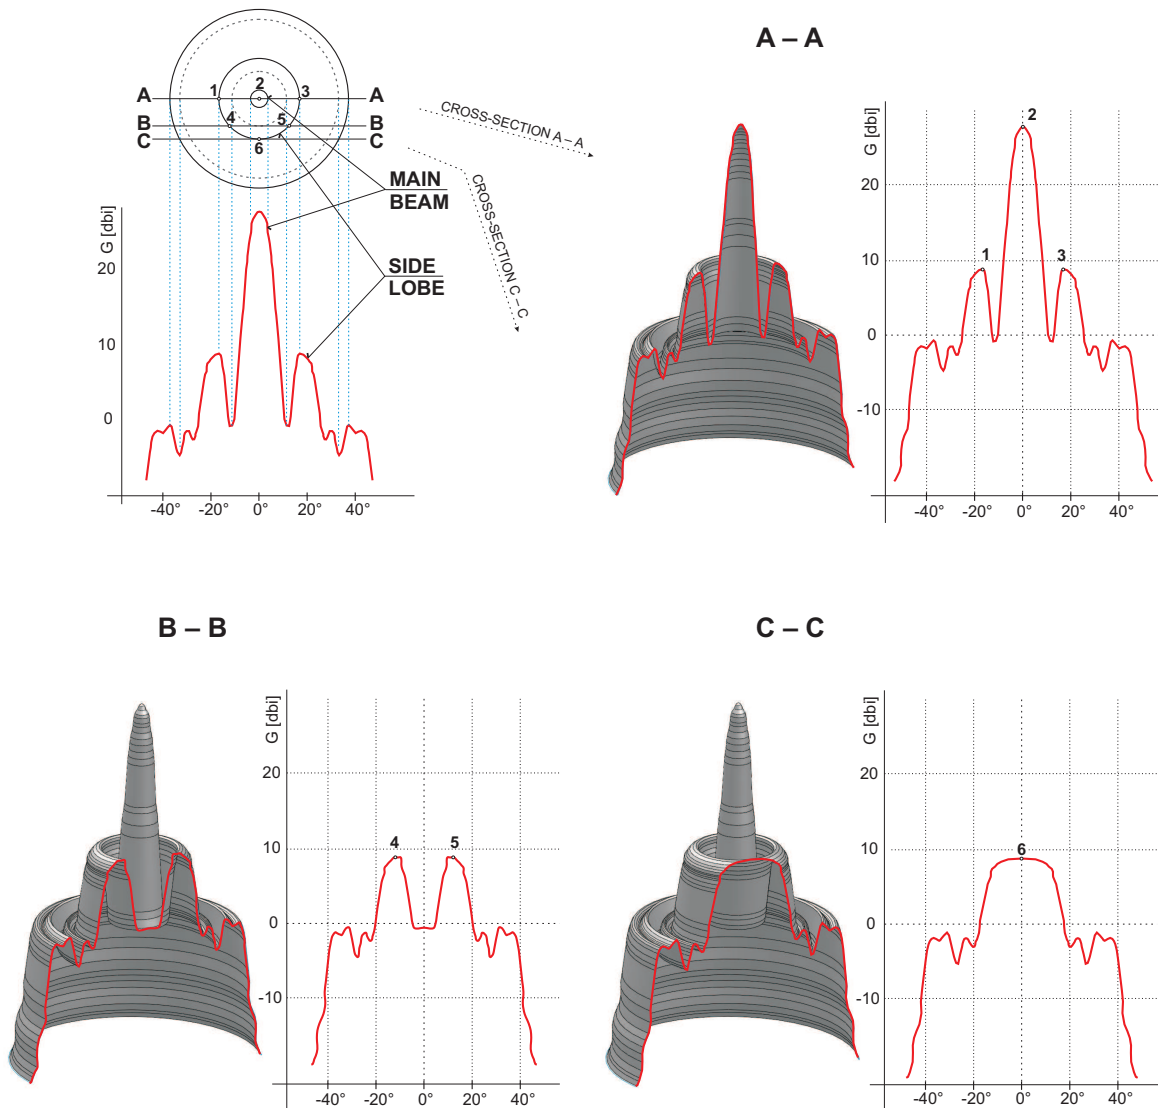

Fig. 5.71: Radiation diagrams

Both antennas should be oriented towards each other using the peaks of radiation diagram. Adjust the antenna alternately in the horizontal and vertical axes and monitor the resulting signal strength. Use the calculation of the expected RSS with the precision of several dBm as guidance. Side lobes transmit signal ca 20 dBm weaker, see the Microwave link Calculation<sup>3</sup>.

<sup>3</sup> <http://www.racom.eu/eng/products/microwave-link.html#calculation>

The resulting RSS helps distinguish between the states A-A and C-C which appear similar. It also helps in situations where simple search for a maximum doesn't work as shown in the illustration "incorrect adjustment".

Real radiation diagrams are more complex, especially in that they run differently in horizontal and vertical axes. The basic steps for determining the main radiation lobe however stay valid. For example:

Fig. 5.72: Radiation diagram – incorrect adjustment

Fig. 5.73: 3D example of more complicated Radiation Pattern

### 5.5.3. Link test

Basic parameters of the link are shown in the menu *Status – Brief*, its quality is characterized by RSS and SNR. Values on Status screens can be refreshed manually by pressing the Refresh button or in real time with a period of several seconds after activating the Start button. Press the Stop button to terminate the periodic refresh of values.

The RSS, SNR and BER values can also be viewed on the screen *Tools – Graphics – Bar indicators*. After pressing the Start button, values will be refreshed with a period of one second.

After installation, it is good to reset the statistics using the Clear stats button in menu *Status – Detailed*. This allows easier diagnostics of the link's reliability over time.

### 5.5.4. Parameters setup

After both antennas have been directed, setup operation parameters for the link. In case of links operating in the free band, setup the parameters based on survey results from the tool *Tools – Graphics – Frequency analyser*. In case of links operating in licensed band, setup the parameters based on assigned license:

- Bandwidth
- Channel Selection (TX / RX channel)
- Modulation (TX modulation) – ACM is recommended. When selecting fixed modulation it is necessary to account for the fade margin. If fixed modulation is setup close to a possible maximum, then a deterioration in RSS could endanger the link both for data transfer as well as service access.
- Transmit power (RF power), or ATPC
- Verify and record IP addresses
- Define access channels – https / telnet / ssh / ssh with password

Restart both units by interrupting their power supply and verify the status of the link. This verifies that all parameters have been stored correctly in the memory.

Select *Tools – Maintenance – Backup – Settings – Backup - Download* and save the configuration to backup file "cnf\_backup.tgz".

This completes the installation. Further configuration can be performed remotely.

## 6. Configuration

### Controls

The following configuration buttons are used for configuration:

- Apply**            Apply and save parameters.
- Cancel**           Set parameters are overwritten with original values.
- Refresh**        Reload the current values of the station / both stations.  
Should the configuration be changed from other management session, the message *Info: Configuration changed, please click refresh* is displayed at the status bar (see screenshot lower). The *Refresh* button reloads valid data and refreshes web browser screen.
- Load defaults**   Load default values of the parameters on the screen. To use any of these values, you must use the *Apply* button.
- Load custom**    Loads values of individual parameters from backup configuration. To use any of these values, you must use the *Apply* button. For loading backup configuration see menu *Tools – Maintenance – Backup – Settings – Upload*.
- Start**            Use the *Start* button to start automatic refresh of displayed information. Information subject to this update are highlighted with a refresh icon.
- Stop**            Use the *Stop* button to stop automatic refresh of displayed information.

Fig. 6.1: Info Refresh

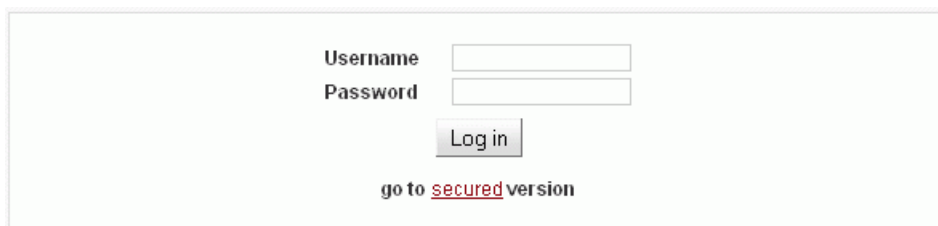

### Help

The microwave link configuration system is equipped with built in Help - see Help section. The Help is accessible in two forms:

- Configuration parameter context help. The help text is displayed in the pop up window after clicking the parameter name.
- The whole user interface help. The help text is displayed within the configuration screen after clicking the *Help* menu.

## Secure login

You can login into the configuration interface either using the **insecure http** protocol or the **secure https** protocol - by click to *go to secured version*. You can select the connection method on the login screen. If the https protocol is used, it is not possible to tap the network communication and acquire the station's login information.

The image shows a login form with two input fields: 'Username' and 'Password'. Below the fields is a 'Log in' button. At the bottom of the form, there is a link that says 'go to [secured](#) version'.

Fig. 6.2: Login

## Rollback function

If you interrupt the connection on an operating link by entering inappropriate radio link parameters, the original parameters will be restored after 1 minute. The connection is automatically restored.

## 6.1. Status bar

Fig. 6.3: Status bar 1

Status bar is located on the upper part of the screen below the title bar. It consists of 3 fields:

- Local station status (station, user is directly connected to via its management IP address).
- Local to Peer link status.
- Peer station status.

Local and Peer field displays:

- Station name according to configuration.
- Actual time valid for respective station.
- Warning or Alarm icon in case a warning or alarm occurs.

Link field displays:

- Status of the link between both sides of the station.
- Warning icon when the link is not capable of user data transfer.

Link status can be one of the following values:

UNKNOWN	Station start up. The initialization is not yet finished.
SETUP	Station initialization according to valid configuration.
SINGLE	Station in operation status. Link to peer station is not established.
CONNECTING	Connection to peer station in progress.
AUTHORIZING	Authorization of the peer station in progress.
OK	Link is connected. Peer station is authorized.
ANALYZER	Spectrum analyzer mode active. User data are not transferred.

All states, except the OK state, are highlighted by warning icon:

Fig. 6.4: Status bar 2

## 6.2. Status

Local: Location\_A / 14:10      Link: [Ok](#)      Peer: Location\_B / 14:10

**Brief**    **Detailed**

**Device**

	Local	Peer
Unit code	RAY17	RAY17
Station name	<a href="#">Location_A</a>	<a href="#">Location_B</a>
Inside temperature [°C]	55.5	57.0
Voltage [V]	56.2	56.5

**Radio**

	Local	Peer
Bandwidth [MHz]	<a href="#">28 MHz</a>	<a href="#">28 MHz</a>
TX channel [GHz]	<a href="#">L4   17.11400</a>	<a href="#">U29   17.20150</a>
RX channel [GHz]	<a href="#">U29   17.20150</a>	<a href="#">L4   17.11400</a>
TX modulation	<a href="#">QAM256 ACM / QAM256</a>	<a href="#">QAM128 ACM / QAM256</a>

Refresh    Start    Stop

Fig. 6.5: Menu Status

Menu *Status – Brief* and *Status – Detailed* contains basic information about local and remote (Peer) station. Information is refreshed manually by pressing the *Refresh* button, or automatically after pressing the *Start* button.

*Status – Brief* shows only the most important values. *Status – Detailed* provides further details. Below is a list of all values - according to the menu *Status – Detailed*.

### 6.2.1. Status – Device

The *Device* menu provides basic information about local and remote station. Informations are valid at the moment the page is open, or the *Refresh* button is pushed.

<b>Unit code</b>	Station type indicator.
<b>Serial no.</b>	Station serial number.
<b>Station name</b>	Station name selected by user.
<b>Station location</b>	Unit location assigned by user.

<b>Firmware version</b>	Station's firmware version.
<b>Date, Time</b>	The internal real-time clock. The clock is set manually or it is synchronized with NTP server and set for both stations.
<b>Inside temperature [°C]</b>	Temperature inside the station.
<b>Voltage [V]</b>	Station's power supply voltage level.

### 6.2.2. Status – Radio

<b>Radio type</b>	Radio unit type: L (Lower) or U (Upper) part of the frequency band.
<b>Polarization</b>	Horizontal or vertical polarization based on the physical installation. Indicates the polarization of received signal. Local and Peer are indicated separately. The proper position of the cable is sideways down. Notice for ISM connections (RAy17, RAY24): One side of the link must be installed in vertical polarization and the other in the horizontal polarization.
<b>Frequency table</b>	Displays the currently selected frequency table.
<b>Bandwidth [MHz]</b>	Nominal width of the channel. Both units in a link have to use the same bandwidth.
<b>TX channel [GHz] RX channel [GHz]</b>	Used channels. Both number of the channel and frequency in GHz are listed.
<b>TX modulation</b>	Modulation type currently used for transmitting. When adaptive modulation is enabled, the ACM letters are displayed as well as information about maximum permitted modulation: "current modulation ACM / maximum modulation"
<b>TX power [dBm]</b>	Current output power on the RF channel in dBm. If ATPC is enabled, the ATPC letters are displayed as well as information about maximum permitted power: "current power ATPC / maximum power"
<b>Net bitrate [Mbps]</b>	Current transfer capacity of radio channel for user data.
<b>Max. net bitrate [Mbps]</b>	The maximum RF channel capacity according to installed feature key.
<b>RSS [dBm]</b>	Received signal strength. If ATPC is enabled, the ATPC letters are displayed as well as information about threshold value for activation of power control loop: "current RSS ATPC / threshold RSS"
<b>SNR [dB]</b>	Signal to Noise Ratio. If ATPC is enabled, the ATPC letters are displayed as well as information about threshold value for activation of power control loop: "current SNR ATPC / threshold SNR"
<b>BER [-]</b>	Bit Error Rate registered at the receiving end. Instantaneous value.
<b>Link uptime</b>	Time elapsed since the current link connection has been established.

### 6.2.3. Status – Ethernet

<b>Ethernet link mode</b>	Status of ethernet interface. Current bit rate (10 = 10BASE-T, 100 = 100BASE-TX and 1000 = 1000BASE-T) and state of duplex (FD = full duplex, HD = half duplex).
<b>MDIX</b>	Status of the internal crossover of ethernet cables. (MDIX = internally crossed pairs, MDI = direct connection, N/A means an unknown state).
<b>Storm control</b>	Switch blocking protection status.
<b>QoS</b>	Switch Quality of Service status.

### 6.2.4. Status – Service access

<b>MAC address</b>	HW address of the ethernet module.
<b>IPv4 address</b>	IP address in the standard dotted decimal notation, including the bit width of netmask after the forward slash.
<b>Services</b>	Services enabled for station management and monitoring (HTTPS, SSH, Telnet, SNMP, NTP).
<b>Management VLAN</b>	Service access via VLAN management only.

### 6.2.5. Status – Statistics

Detailed traffic statistics in the user interface.

<b>In All Packets</b>	Number of all received packets.
<b>In Unicast Packets</b>	Counter of unicast packets received.
<b>In Multicast Packets</b>	Counter of multicast packets received.
<b>In Broadcast Packets</b>	Counter of broadcast packets received.
<b>In All Errors</b>	Counter of all packet errors (including dropped).
<b>In Dropped Packets</b>	Counter of received packets, dropped.
<b>In Crc Errors</b>	Counter of corrupted packets (CRC error) received. Usually indicates a problem on Eth cable or connector.
<b>Out All Packets</b>	Number of all outgoing packets.
<b>Out Unicast Packets</b>	Counter of outgoing unicast packets.
<b>Out Multicast Packets</b>	Counter of outgoing multicast packets.
<b>Out Broadcast Packets</b>	Counter of outgoing broadcast packets.
<b>Out All Errors</b>	Number of outgoing packet errors.
<b>Out Dropped Packets</b>	Counter of dropped outgoing packets.
<b>Out Collision Packets</b>	Counter of detected collisions in transmission.

#### Information on statistical data

<b>Statistics cleared</b>	Time of log clearing.
<b>Statistics period</b>	Period of log refresh.

#### Radio link statistics

<b>Overall Link Uptime</b>	Overall time the link has been connected.
<b>Overall Link Downtime</b>	Overall time the link has been disconnected.
<b>Reliability [%]</b>	The ratio of "Uptime" and "Downtime".
<b>Current Link Uptime</b>	Current time the link has been connected.
<b>The Longest Drop</b>	The longest downtime period recorded.
<b>The Last Drop</b>	Length of the last link interruption.
<b>No of Drops</b>	Number of link interruptions.

## 6.3. Settings

### 6.3.1. Settings – General

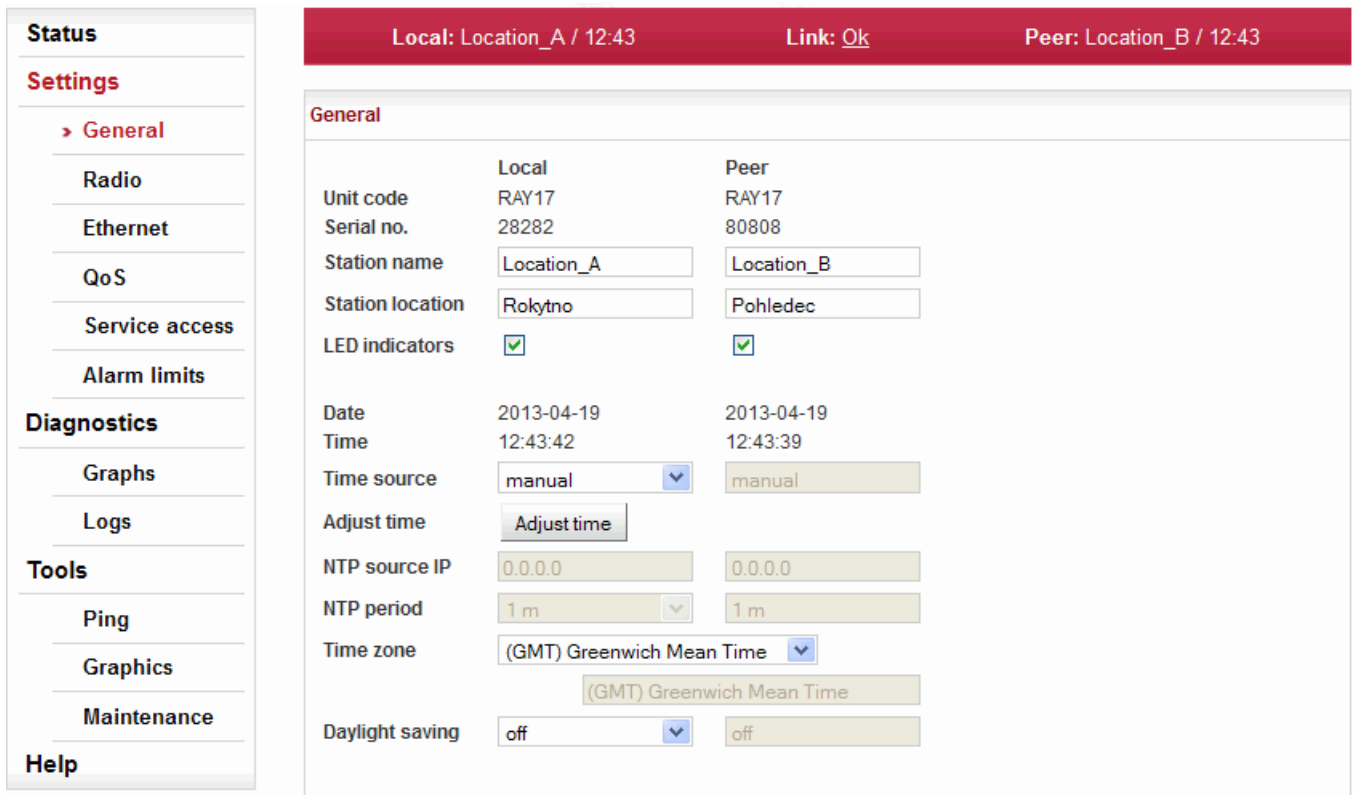

Fig. 6.6: Menu Settings – General

Setup of general parameters of the link.

<b>Unit code</b>	Station type indicator.
<b>Serial no.</b>	Station serial number.
<b>Station name</b>	Station name selected by user.
<b>Station location</b>	Unit location assigned by user.
<b>LED indicators</b>	Enable LED status indicators on the body of the station. You can turn off all LEDs with this option.
<b>Date, Time</b>	The internal real-time clock. The clock is set manually or it is synchronized with NTP server and set for both stations.
<b>Time source</b>	Time synchronization source setup. Manual setup or NTP protocol use. For easier diagnostics of link operation, it is recommended to use the NTP time synchronization.

### Adjust time

Manual time setup. Use the dialog box to manually set the current date and time. You can copy time from browser (local PC).

The dialog box titled "Adjust time" contains two input fields: "Date [yyyy-MM-dd]" with the value "2013-11-05" and "Time [hh:mm:ss]" with the value "13:31:30". Below these fields is a button labeled "Copy local time". At the bottom of the dialog are two buttons: "Apply" and "Cancel".

### NTP source IP

IP address of the time synchronization server.

### NTP period

Time synchronization interval.

### Time zone

Time zone

### Daylight saving

Enable daylight saving time

### Note

When the time zone and/or daylight saving time is changed, the original values set in the RAY unit are kept. The actual change takes place after OS restart in order to prevent unexpected states related with local time change.

## 6.3.2. Settings – Radio

The screenshot shows the "Settings – Radio" configuration page. On the left is a sidebar with navigation options: Status, Settings (selected), General, Radio (selected), Ethernet, QoS, Service access, Alarm limits, Diagnostics, Graphs, Logs, Tools, Ping, Graphics, Maintenance, and Help. The main panel has a red header bar with "Local: Location\_A / 06:55", "Link: Ok", and "Peer: Location\_B / 06:55". Below the header is the "Radio" configuration table:

	Local	Peer
Radio type	L	U
Polarization	horizontal	vertical
Bandwidth [MHz]	28 MHz	28 MHz
TX channel [GHz]	L4   17.11400	U29   17.20150
RX channel [GHz]	U29   17.20150	L4   17.11400
Duplex spacing [MHz]	87.500	
ACM	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
TX modulation	QAM128	QAM256
ATPC	<input type="checkbox"/>	<input type="checkbox"/>
TX power [dBm]	-20	-15
Antenna gain [dBi]	8.00	10.00
EIRP ?= limit [dBm]	-12.00 <= 20.00	-5.00 <= 20.00

At the bottom of the main panel are buttons for "Apply", "Cancel", "Refresh", "Load defaults", and "Load custom".

Fig. 6.7: Configuration menu Settings – Radio

Setup of general parameters of the radio link.

### Radio type

Information about the type of radio unit: L(ower) or U(pper) band.

<b>Polarization</b>	Horizontal or vertical polarization based on the physical installation. Indicates the polarization of received signal. Local and Peer are indicated separately. The proper position of the cable is sideways down. Notice for ISM connections (RAy17, RAY24): One side of the link must be installed in vertical polarization and the other in the horizontal polarization.
<b>Bandwidth [MHz]</b>	One of standard channel widths can be selected. This parameter must be set identically in local and remote.
<b>TX channel [GHz]</b> <b>RX channel [GHz]</b>	TX and RX channels are selected from a list of channels. The basic configuration has the TX and RX options interconnected. In this case the basic duplex spacing between channels is preserved and by selecting one channel, the other three are defined as well. For stations operating in free bands, it is possible to disconnect the TX-RX lock and select TX and RX channels individually. Corresponding channels at peer station are set automatically. <i>Notice</i> – Non-standard duplex setting leads to non-effective use of the spectrum.
<b>Duplex spacing [MHz]</b>	Information about duplex spacing of TX and RX channel.
<b>ACM</b>	Enable automatic control of modulation.
<b>TX modulation</b>	Modulation level for TX channel. You can select in range from QPSK (high sensitivity for difficult conditions) to 256QAM (high speed under appropriate conditions). In case of enabled ACM it has the meaning of the maximum (highest) allowed modulation.
<b>ATPC</b>	Enable automatic control of RF power. Power is regulated towards lower values while maintaining highest modulation level. Maximum output power is limited by <b>Tx power</b> parameter. The power control loop is primarily controlled by RSS. The SNR value is taken into account as well, because the situation of high interference value can lead to high RSS but low SNR.
<b>TX power [dBm]</b>	Desired output RF power. In case of enabled ATPC it has the meaning of the maximum allowed power.
<b>Antenna gain [dBi]</b>	Only for links operating in the ISM band (RAy17, RAY24). Gain of used antenna. It is used to calculate approximate EIRP.
<b>EIRP ?= limit [dBm]</b>	Only for links operating in the ISM band (RAy17, RAY24). Approximate calculation of EIRP. Number on the right shows the allowed EIRP limit. Sign between numbers gives information on compliance/non-compliance with allowed EIRP limits.

### 6.3.3. Settings – Ethernet

The screenshot shows the Ethernet configuration interface. At the top, a red status bar displays 'Local: Location\_A / 08:06', 'Link: Ok', and 'Peer: Location\_B / 08:06'. Below this, there are two tabs: 'Management' (selected) and 'Storm control'. The 'Management' tab contains several settings for both 'Local' and 'Peer' sides:

Setting	Local	Peer
Ethernet link mode	auto	auto
MDIX	auto	auto
Flow control	off	off
MTU	1536	1536
Internal VLAN id	2	2

Below the settings, a note states: 'Note: Activating flow control will disable QoS (802.1p, DSCP, port priority) and smart discard.' At the bottom of the configuration area, there are five buttons: 'Apply', 'Cancel', 'Refresh', 'Load defaults', and 'Load custom'.

Fig. 6.8: Configuration menu Settings – Ethernet

#### Management

Ethernet interface physical layer parameters setup.

<b>Ethernet link mode</b>	Switching between transfer speed and flow control automatic negotiation or manual setting.
<b>MDIX</b>	Media Dependent Interface Crossover enables working with both types of ethernet cables, straight-through and crossover. The default option "auto" switches on automatic detection and performs an internal crossover if necessary.
<b>Flow control</b>	Mechanism for temporarily stopping the transmission of data on an ethernet network. Enabling flow control allows use of buffers of connected active network elements for levelling uneven flow of user data. If flow control is enabled, you cannot use the built-in QoS functions. For correct operation it is necessary to also enable Flow control on the connected device.
<b>MTU</b>	Setup of maximum allowed length of Ethernet frame. If transfer of tagged frames is not needed, you can choose smaller MTU. If you select smaller MTU, more storage space is available for QoS.
<b>Internal VLAN id</b>	The RAY unit uses one VLAN id for internal needs. It can be changed if there is a conflict with user data.

#### Storm control

Protection against packet flooding and subsequent device input switch blocking:

<b>Broadcast</b>	traffic directed to broadcast address (DA=FFFFFFFFFFFFH)
<b>Multicast</b>	traffic directed to multicast addresses (DA[40]=1B)
<b>Un-learned unicast</b>	un-learned unicast traffic
<b>100Mb/1Gb 10Mb threshold [pkts/50ms]</b>	Setting the threshold to activate protection. Set as number of packets per 50ms. Set separately for 10Mb link speed, or for 100Mb and 1Gb link speeds.

### 6.3.4. Settings – QoS

The Quality of Service (QoS) menu groups together multiple options of manipulating user data flow.

#### Ingress policing

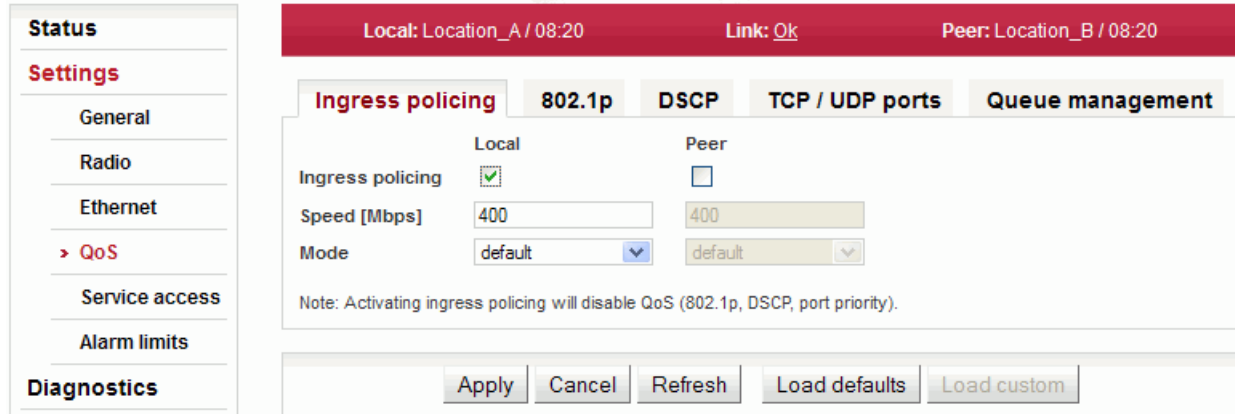

Fig. 6.9: Configuration menu Settings – QoS

Ingress policing – causes user data flow to be limited to certain value. The excessive packets are discarded.

#### Ingress policing

Enable Ingress policing. Applies to the device user port.

#### Speed [Mbps]

Data rate to limit the Ethernet traffic to. If this speed is exceeded, Flow control is initiated. If packets are still incoming, they are dropped.

#### Mode

Ingress policer operation mode:

- **soft** – Flow control is activated at low fill of input buffer. Good to use if the connected device has Flow control enabled and has a large buffer.
- **default** – Universal settings. Close to “hard” settings, but with Flow control enabled at connected device, packet loss is not possible.
- **hard** – Flow control is activated only after the input buffer is completely full. Good to use if the connected device has a small buffer.

#### Warning

The Ingress policing activation deactivates the switch QoS functions.

## 802.1p

Local: Location\_A / 12:52      Link: [Ok](#)      Peer: Location\_B / 12:52

**Ingress policing**    **802.1p**    **DSCP**    **TCP / UDP ports**    **Queue management**

	Local	Peer
802.1p	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Prefer DSCP	<input type="checkbox"/>	<input type="checkbox"/>
Class of service		
0	0	0
1	0	0
2	1	1
3	1	1
4	2	2
5	2	2
6	3	3
7	3	3

Note: Activating QoS will disable flow control and ingress policing.

[Apply](#)    [Cancel](#)    [Refresh](#)    [Load defaults](#)    [Load custom](#)

Fig. 6.10: Configuration menu Settings – QoS – 802.1p

Setup of QoS controlled by priority bits according to IEEE 802.1p.

**802.1p**

Enabling QoS according to 802.1p

**Prefer DSCP**

If priority control is enabled according to DSCP and incoming packet is coloured both by 802.1p priority and by DSCP – prioritization is governed (when enabling this option) by the DSCP rules.

**Class of service 0..7**

Arranging individual priorities (coded in priority bits according to IEEE 802.1p) into selected output queue (0..3).

**Warning**

The QoS activation deactivates the Flow control and Ingress policing.

DSCP

Local: Location\_A / 12:53

15	0	0	31	1	1	47	2	2	63	3	3

Note: Activating QoS will disable flow control and ingress policing.

Apply
Cancel
Refresh
Load defaults
Load custom

Fig. 6.11: Configuration menu Settings – QoS – DSCP

Setting of QoS governed by DSCP priority bits (Differentiated Services, or DiffServ) in the IP header.

**DSCP**            Enabling QoS according to DSCP

**DSCP 0..63**    Arranging individual priorities (coded in DS field of IP header) into selected output queue (0..3).

**Warning**

The QoS activation deactivates the Flow control and Ingress policing.

## TCP/UDP ports

Local: Location\_A / 12:56      Link: Ok      Peer: Location\_B / 12:56

**Ingress policing**    802.1p    DSCP    **TCP / UDP ports**    Queue management

Local    Peer

TCP / UDP ports       

Prefer DSCP       

Stream	Local				Peer			
	From	To	Side	Queue	From	To	Side	Queue
0	0	0	source	0	0	0	source	0
1	0	0	source	0	0	0	source	0
2	0	0	source	0	0	0	source	0
3	0	0	source	0	0	0	source	0
4	0	0	source	0	0	0	source	0
5	0	0	source	0	0	0	source	0
6	0	0	source	0	0	0	source	0
7	0	0	source	0	0	0	source	0

Note: Activating QoS will disable flow control and ingress policing.

Apply    Cancel    Refresh    Load defaults    Load custom

Fig. 6.12: Configuration menu Settings – QoS – TCP/UDP ports

Setting of QoS governed by number or range of TCP/UDP ports.

**TCP/UDP ports**    Enabling QoS according to TCP/UDP ports.

**Prefer DSCP**    If priority control is enabled according to DSCP and incoming packet is coloured both by DSCP priority and matches one of the rules listed here – prioritization is governed (with this option enabled) by the DSCP rules.

**Stream 0..7**    Up to 8 ranges of TCP/UDP ports can be configured. The range applies to both protocols: TCP and UDP.

- **From** – Start of TCP/UDP ports range.
- **To** – End of TCP/UDP ports range. If we want to prioritize only one port, use same values for “From” and “To”. The range of TCP/UDP ports can be up to 255.
- **Side** – Defines whether it is a source or destination TCP/UDP port(s).
- **Queue** – The target output queue for packets matching the rule.

### Warning

The QoS activation deactivates the Flow control and Ingress policing.

Queue management

Mode	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Ratio Mode	<input type="checkbox"/>		<input checked="" type="checkbox"/>	

Queue	Bitrate [Mbps]		Bitrate [Mbps]	
0	<input type="text" value="400"/>	<input type="text" value="1"/>	<input type="text" value="400"/>	<input type="text" value="2"/>
1	<input type="text" value="100"/>	<input type="text" value="1"/>	<input type="text" value="400"/>	<input type="text" value="1"/>
2	<input type="text" value="50"/>	<input type="text" value="1"/>	<input type="text" value="400"/>	<input type="text" value="1"/>
3	<input type="text" value="100"/>	<input type="text" value="1"/>	<input type="text" value="400"/>	<input type="text" value="1"/>

**Smart discard**

Queue	Local	Peer
0	<input type="text" value="Mode 0 (0/0)"/>	<input type="text" value="Mode 0 (0/0)"/>
1	<input type="text" value="Mode 1 (0/25)"/>	<input type="text" value="Mode 0 (0/0)"/>
2	<input type="text" value="Mode 0 (0/0)"/>	<input type="text" value="Mode 0 (0/0)"/>
3	<input type="text" value="Mode 0 (0/0)"/>	<input type="text" value="Mode 0 (0/0)"/>

Note: For enabling queue management mode activate at least one QoS rule (802.1p, DSCP, port priority).  
Note: Activating smart discard will disable flow control.

Fig. 6.13: Configuration menu Settings – QoS – Queue management

Setting the operation mode of output queues. These are internal switch queues for organization of packets based on individual QoS rules.

**Note**

To enable configuring output queues, you must enable at least one of the QoS rules.

**Mode**

Regime for sending out packets from individual queues.

- **Strict** – If there are packets in a high priority queue, packets from that queue are sent out. Only after this queue is completely empty, packets from a lower priority queue are sent out.
- **WFQ** – Weighted Fair Queuing. Packets from individual queues are sent out according to set ratios (see below).

**Ratio Mode**

Turns on the WFQ regime sending out ratio.

**Queue 0..3**

Setting parameters (ratios) of packets sending out for individual queues.

- **Strict column** – Maximum output speed [Mbps] for individual queues. Allowed range 0 .. 400 [Mbps]
- **WFQ Column** – Packet sending out ratios for individual queues. Higher values means more frequent sending out from the given queue.

## Smart discard

Setting mode for packet dropping in case of insufficient output channel capacity. Packets are dropped with certain probability before the queue is filled completely. For example, this mechanism prevents blocking of high priority packets by low priority packets. The “early random discard” mechanism is proving to be useful particularly for TCP traffic.

Smart discard mode can be used independently of QoS. To ensure correct function of *Smart discard* (i.e. Mode 1..3) *Flow control* is off.

- Queue 0..3** Setting drop mode for individual output queues
- Mode 0 (0/0) – Packets are dropped only after output queue is fully congested. Smart discard mode is therefore turned off.
  - Mode 1 (0/25) – When the queue is full to 3/4, packets will be dropped with 25% probability.
  - Mode 2 (25/50) – When the queue is full to 2/3, packets will be dropped with 25% probability. When the queue is full to 3/4, packets will be dropped with 50% probability.
  - Mode 3 (50/75) – When the queue is full to 2/3, packets will be dropped with 50% probability. When the queue is full to 3/4, packets will be dropped with 75% probability.

### Warning

The *Smart discard* mode activation deactivates the *Flow control*.

### 6.3.5. Settings – Service access

#### Services

Access routes for link configuration.

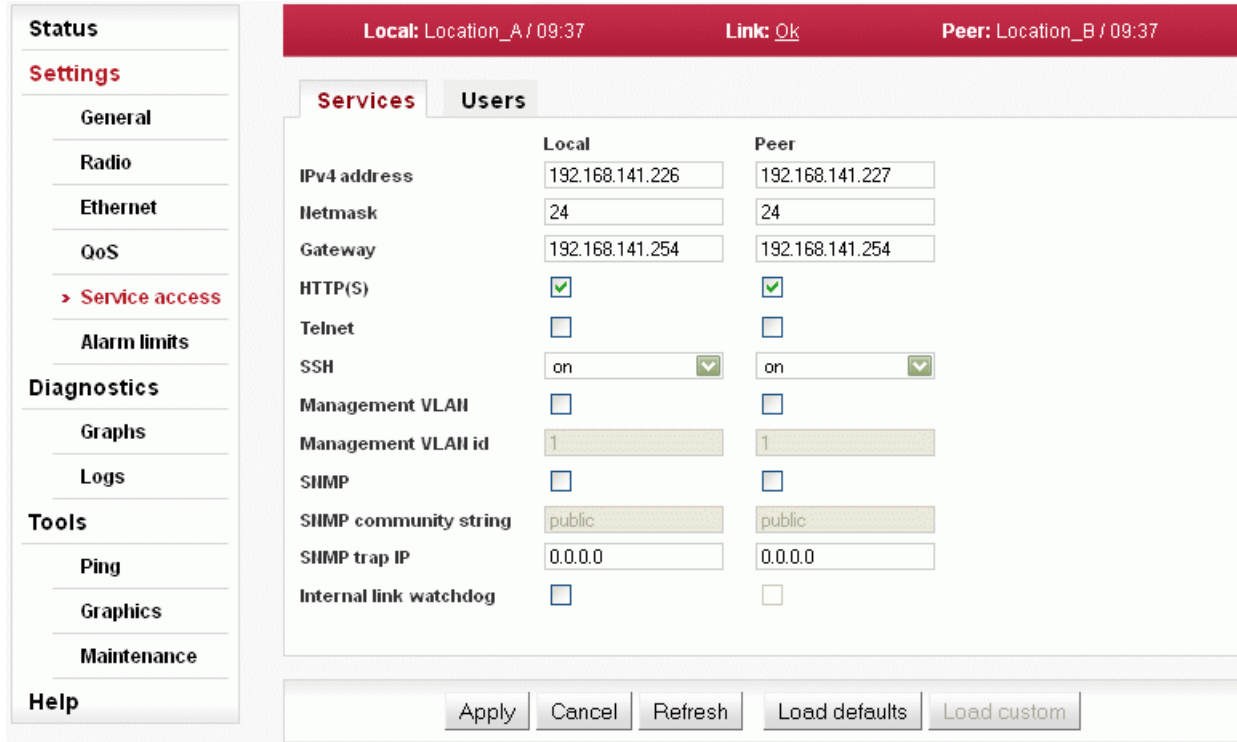

Fig. 6.14: Configuration menu Settings – Service access – Services

**IPv4 address** Service IP address, by default 192.168.169.169 for L station and 192.168.169.170 for U station. Four addresses 169.254.173.236/30 are used for internal communication. Must not be used as service IP address.

**Unknown IP address** For easier identification of service IP address, RAY is equipped with LLDP protocol. Protocol sends a broadcast every 60 seconds with the following information:

- IP address – under LLDP: Management address
- Serial number – LLDP: System Description
- Type (e.g. RAY17\_L) – LLDP: Chassis Subtype
- DATA\_PORT for version with 1 eth or SERVICE\_PORT for version with 2 eth – under LLDP: Port Subtype

Message can be recorded and converted into a readable form using a LLDP client. A suitable tool for this purpose is Wireshark IP traffic analysing tool, with free licenses available both for Windows and Linux. To locate the message easily, use the Capture filter "ether proto 0x88cc" in Wireshark.

**Netmask** Mask for service access, 24 by default.

**Gateway** Default gateway for service access, empty by default.

**HTTP(S)** Allowing access via HTTP server (for HTTP and HTTPS protocol). Attention: after disabling access via HTTP server, you will not be able to access the unit using a web browser!

---

<b>Telnet</b>	Enabling access via Telnet server. Provides access to CLI (Command Line Interface) for simple telnet clients. Disabled by default.
<b>SSH</b>	Enabling access via SSH server. Provides secure access to CLI. If preventing unauthorized access to the station is number one priority, leave only this server on.
<b>Management VLAN</b>	Enabling access via VLAN management. Blocks access for https, ssh and telnet configuration via untagged packets (without VLAN) making only VLAN access possible. VLAN management is off by default. In case of RAY unit with two ports, VLAN management applies to the service port. - ATTENTION- By enabling VLAN management, ALL accesses are blocked for configuration using normal (untagged) LAN! During tests, you may enable VLAN management on one unit only. Then it is possible to access the link via LAN and VLAN either directly or via radio link.
<b>Management VLAN id</b>	VLAN management id, by default 1. This field has to be filled out even when VLAN management is not active.
<b>SNMP</b>	Enabling SNMP server. Off by default.
<b>SNMP community string</b>	SNMP community string. Can contain both lower and uppercase letters, numbers, four characters . : _ - and can be up to 256 characters long.
<b>SNMP trap IP</b>	Address for sending SNMP traps.
<b>Internal link watchdog</b>	Watching over connection of both link units. In case of prolonged failure (10 min) a cold restart is done (the equivalent of turning off the power). Off by default.

## Users

List and setup of users. There can be different users on either side of the link.

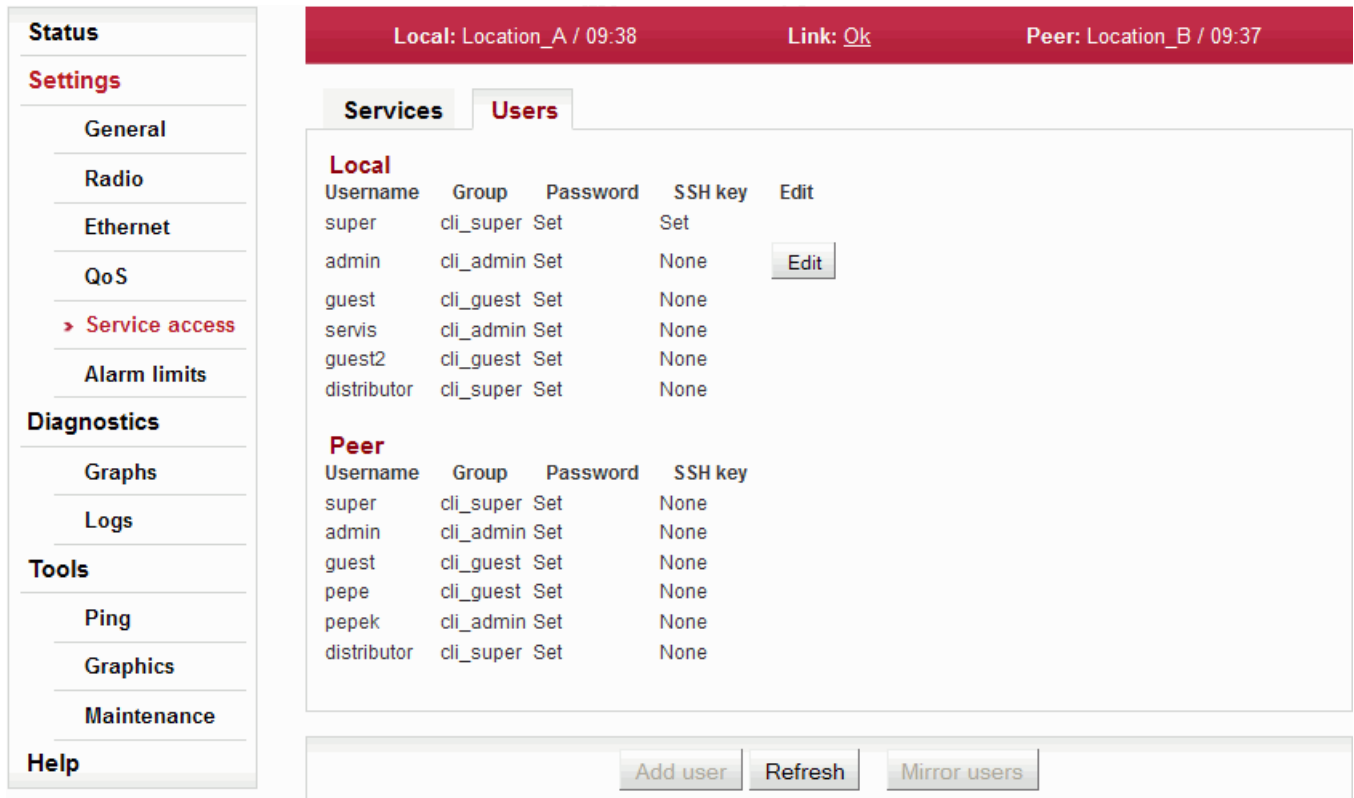

Fig. 6.15: Configuration menu Settings – Service access – Users

**Local, Peer** List of users on Local and Peer stations.

**Username** User name. This name is entered as Login to log into the link management.

**Group** User group to which the user belongs.

**cli\_guest** This group has the right to only view the setting of the link. Does not have rights to modify the settings. A group can contain a maximum of 10 users.

**cli\_admin** The group has all the rights of group cli\_guest plus:  
Right to configure the link. Has the right to view and modify all settings (except for user accounts and special actions of the user *distributor*). A group can contain a maximum of 10 users.

**cli\_super** Same rights as cli\_admin plus:  
Right to configure user accounts including SSH keys.. This group contains only two users:

User *super*.

User *distributor* has an additional right to change special configuration items. The password for this user cannot be changed.

**Password** Information about whether user has a password

**SSH key** Information about whether user has at least one ssh key defined.

**Edit user**

Clicking *Edit* next to a username opens a screen with configuration of the given account.

The screenshot shows the 'Edit user' configuration interface. It has two tabs: 'Services' and 'Users', with 'Users' selected. The form contains the following fields and options:

- Username:** admin
- Group:** cli\_admin
- Password:** Radio buttons for 'Delete' and 'Set' (selected).
- New password:** Text input field.
- Confirm password:** Text input field.
- SSH key:** Radio buttons for 'Delete', 'Set/replace' (selected), and 'Add'.
- Key file:** Text input field with a 'Procházet...' button next to it.

At the bottom of the form, there are two buttons: 'Apply' and 'Cancel'.

Configuration menu Settings – Service access – Users – Edit

<b>Username</b>	User name
<b>Group</b>	The group to which the user belongs.
<b>Password</b>	Password can be set or deleted. <b>Delete</b> – User will not have a password. The user will only be able to log in with a ssh key. In order to delete the password, you must first upload ssh key. <b>Set</b> – Password settings.
<b>New password</b>	New password.
<b>Confirm password</b>	Repeat password.
<b>SSH key</b>	Working with ssh key. <b>Delete</b> – Clear all ssh keys of the user. <b>Set/replace</b> – Add a new key. If there already was any key(s), it will be overwritten. <b>Add</b> – Add a new key. You can enter multiple ssh keys this way.
<b>Key file</b>	Insert key file.

Save the menu content by clicking on the button *Apply*.

### Delete user

Users from the group cli\_super have a *Delete* button next to them. You can delete a user using that button. User is removed without further queries. Users from the group cli\_super cannot be deleted.

### Add user

The button is located on the bottom bar.

For users from the group cli\_super, the *Add user* button is active. You can use it to create a new user from groups *cli\_quest* or *cli\_admin*.

- Username** Name of new user.
- Group** The group to which this user will belong.
- New password** Password for this user.
- Confirm password** Repeat password.
- SSH key** If you want the user to have access using ssh protocol and identity verification using ssh key, enter the ssh key here.

Create a new user by clicking on the button *Apply*.

### Mirror users

The button is located on the bottom bar.

For users from the group cli\_super, the *Mirror users* button is active. Selecting this function will copy all user accounts from Local station to Peer station. Existing user accounts on the Peer station are deleted (except for the password of distributor, which is unique for each station).

### 6.3.6. Settings – Alarm limits

The screenshot shows the 'Alarm limits' configuration page. At the top, a red status bar displays 'Local: Location\_A / 09:52', 'Link: Ok', and 'Peer: Location\_B / 09:52'. On the left is a navigation menu with categories: Status, Settings (selected), Diagnostics, Tools, and Help. Under 'Settings', sub-menus include General, Radio, Ethernet, QoS, Service access, Alarm limits (selected), Graphs, Logs, Ping, Graphics, and Maintenance. The main content area is titled 'Alarm limits' and contains a table with columns for 'Local Limit', 'SNMP trap', and 'Peer Limit'. Below the table are buttons for 'Apply', 'Cancel', 'Refresh', 'Load defaults', and 'Load custom'.

	Local Limit	SNMP trap	Peer Limit	SNMP trap
Inside temperature [°C]	> 80	<input type="checkbox"/>	80	<input type="checkbox"/>
Memory usage [%]	> 95	<input type="checkbox"/>	95	<input type="checkbox"/>
Voltage min [V]	< 40	<input type="checkbox"/>	40	<input type="checkbox"/>
Voltage max [V]	> 60	<input type="checkbox"/>	60	<input type="checkbox"/>
RSS [dBm]	< -80	<input type="checkbox"/>	-80	<input type="checkbox"/>
SNR [dB]	< 10	<input type="checkbox"/>	10	<input type="checkbox"/>
BER [-]	> 10e-6	<input type="checkbox"/>	10e-6	<input type="checkbox"/>
Peer disconnect		<input type="checkbox"/>		<input type="checkbox"/>
Peer eth link down		<input type="checkbox"/>		<input type="checkbox"/>

Fig. 6.16: Configuration menu Settings – Alarm limits

Diagnostic system of the link monitors the operation of the station. It generates various events as output. There are two kinds of events: Warnings and Alarms. The event is always written to the system log and indicated in the status bar. Some events have configurable thresholds. For each event you can choose whether a SNMP trap should be sent if the event occurs.

List of configurable events with default thresholds:

## Warning

<b>Inside temperature [°C]</b>	<b>&gt;80</b>	Temperature inside the station (on the modem board.)
<b>Memory usage [%]</b>	<b>&gt;90</b>	Memory usage.
<b>Voltage min [V]</b>	<b>&lt;40</b>	Lower threshold of supply voltage.
<b>Voltage max [V]</b>	<b>&gt;70</b>	Upper threshold of supply voltage, SNMP trap on/off is generated same as for Voltage min.
<b>RSS [dBm]</b>	<b>&lt;-80</b>	Received signal strength.
<b>SNR [dBm]</b>	<b>&lt;10</b>	Signal to Noise Ratio.

## Alarm

<b>BER</b>	<b>&gt;10e<sup>-6</sup></b>	Bit Error Rate registered at the receiving end. Instantaneous value.
<b>Peer disconnect</b>		Interruption of radio link.
<b>Peer eth link down</b>		User eth link on Peer station interrupted.
<b>RF power fail</b>		Loss of transmit power (not for RAY17 neither RAY24).

## 6.4. Diagnostics

### 6.4.1. Diagnostics – Graphs

Fig. 6.17: Configuration menu Diagnostics – Graphs

Station continuously stores information about the values of important variables:

<b>Temperature inside the station</b>	Instantaneous value of temperature inside the station. Measured on the modem board. Temperature of radio board is available via SNMP.
<b>Supply voltage</b>	Instantaneous value of station supply voltage.
<b>RSS</b>	Received signal strength.
<b>SNR</b>	Signal-to-noise ratio of the received signal.
<b>BER</b>	Instantaneous bit error rate on link.
<b>Net bitrate</b>	Instantaneous transmission capacity.
<b>Ethernet in throughput</b>	Instantaneous speed (20s average) of incoming user data on the user Ethernet port.
<b>Ethernet out throughput</b>	Instantaneous speed (20s average) of outgoing user data on the user Ethernet port.
<b>TX power</b>	Instantaneous value of transmission power.

The values are saved in the following resolutions and history lengths

- Resolution 1 minute, length of history 1 week
- Resolution 15 minutes, length of history 30 days
- Resolution 1 day, length of history about 180 days

Stored values can be viewed using three methods:

<b>Thumbnails</b>	Preview all values for the last 24 hours
<b>Viewer</b>	Detailed graphical view of one or two selected values for the given interval
<b>Data</b>	Numerical view of all values

## Viewer

Fig. 6.18: Configuration menu Diagnostics – Graphs – Viewer

Detailed graphical view of one or two selected values for the given interval. You can choose to view data from Local or Peer or both.

<b>Primary Y axis</b>	Selecting one of the observed values.
<b>Secondary Y axis</b>	Selecting a second value.
<b>Alarm</b>	Enables the display of alarms, if there were any.
<b>Local</b>	Displays graph from Local unit.
<b>Peer</b>	Displays graph from Peer unit.
<b>Interval</b>	Selecting width of interval to be displayed. Based on the interval width, data are displayed in a suitable grid: Up to 3 hours in at one minute. Up to 4 days at 15 minutes. For longer intervals at one day.
<b>Previous</b>	Move by one width of selected interval towards older values.
<b>Next</b>	Move by one width of selected interval towards newer values.
<b>Last</b>	Move to the newest values.

Data

Local: Location\_A / 12:37      Link: Ok      Peer: Location\_B / 12:37

Fig. 6.19: Configuration menu Diagnostics – Graphs – Data

Detailed graphical view of values for selected interval.

- Plotted**                      Shows only the values that are selected for the graph.
- Local**                         Shows all logged values. Filtering of values from local, remote or both.
- Peer**
- All**

## 6.4.2. Diagnostics – Logs

The screenshot shows the 'Diagnostics – Logs' interface. At the top, it displays 'Local: Location\_A / 09:16', 'Link: Ok', and 'Peer: Location\_B / 09:16'. Below this are tabs for 'Overall', 'Local events', 'Local ACM', 'Local alarms', 'Peer events', 'Peer ACM', and 'Peer alarms'. A 'Filter' box with the number '2' is present. The logs are organized into sections: Local events, Local ACM, Local alarms, Peer events, Peer ACM, and Peer alarms. Each section contains timestamped log entries. A 'Refresh' button is located at the bottom center of the log display area.

Fig. 6.20: Configuration menu Diagnostics – Logs

Shows internal station logs. Individual tabs allow total or filtered view.

When you first open the screen, it is necessary to start browsing logs by pressing the Refresh button.

Listings of all logs can be filtered. You can enter text in the upper left corner window for filtering listings. For example, you want to know when was the configuration of the station modified: On the Local events screen, enter “Configuration” and hit Enter.

You can use plain text or regular expressions for filtering (JavaScript format).

<b>Overall</b>	Displays the last 3 records from all types of logs.
<b>Local events, Peer events</b>	Events from Local or Peer station.
<b>Local ACM, Peer ACM</b>	History of modulation switching if ACM is enabled. Local and Peer station.
<b>Local alarms, Peer alarms</b>	Alarms from Local or Peer station.

Maximum length of displayed logs is 250 entries. If you need to display longer history, use of CLI interface is needed.

## 6.5. Tools

Menu Tools contains several support tools for link diagnostics and management.

### 6.5.1. Tools – Ping

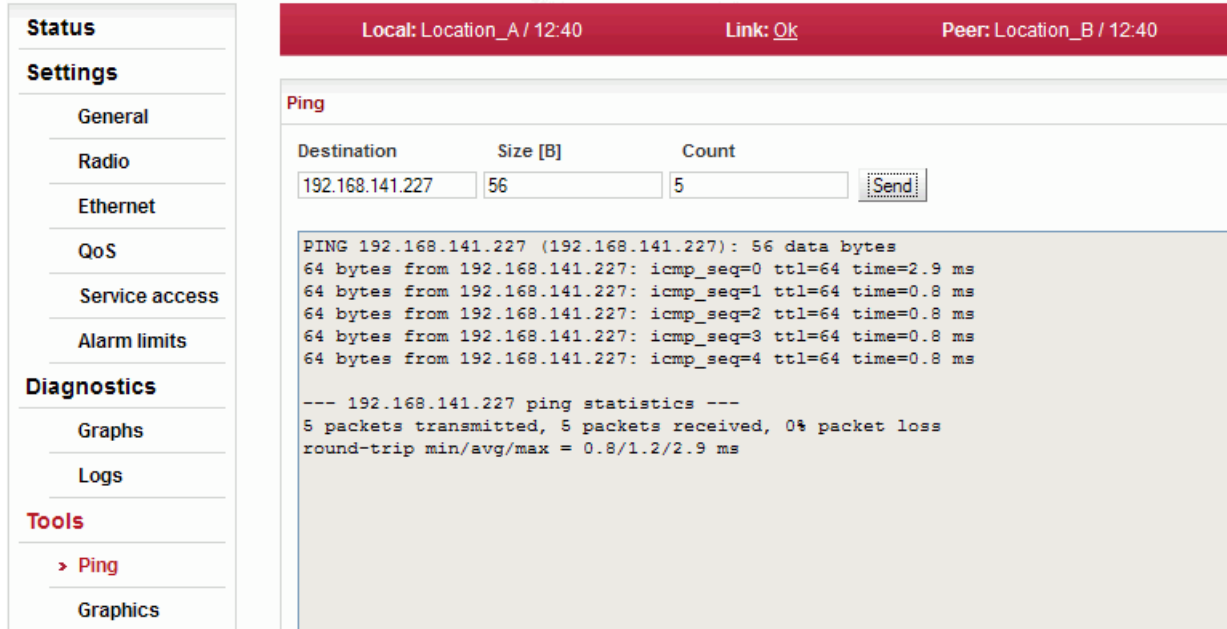

Fig. 6.21: Configuration menu Tools – Ping

The Ping tool allows sending ICMP pings to a selected address

- Destination** Destination address in dotted decimal notation. The default address 127.0.0.1 is the localhost address - i.e. the station itself.
- Size [B]** Length of sent data 7 to 1500 bytes, 8 bytes of the header will be added.
- Timeout** The period for sending pings is constant: 1000 ms.
- Count** Number of sent pings.

Start the test by clicking on **Send**. The result is displayed in the text window.

## 6.5.2. Tools – Graphics

### Bar indicators

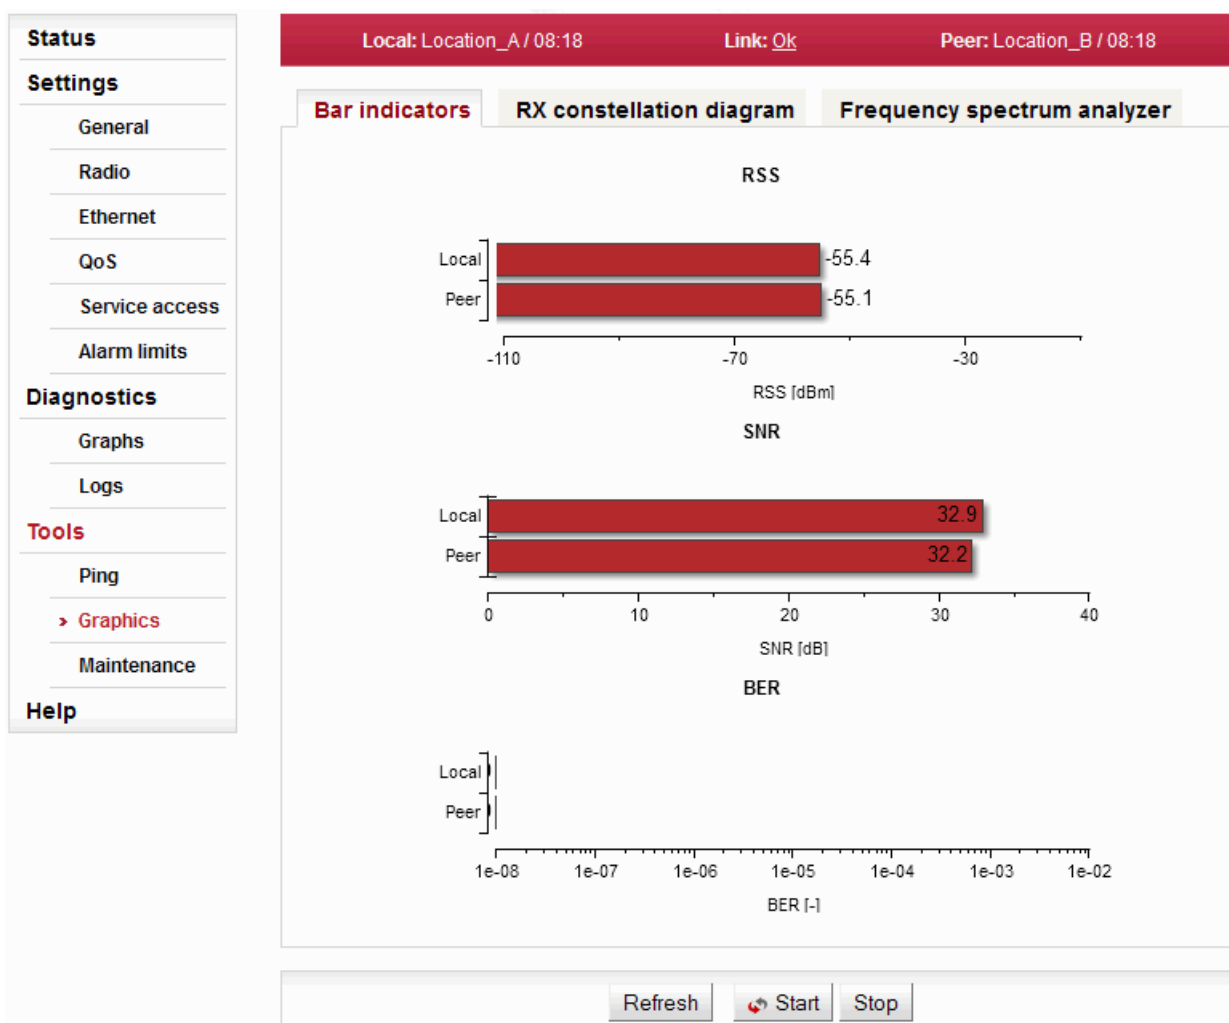

Fig. 6.22: Configuration menu Tools – Graphics – Bar indicators

Graphical indication of BER, SNR and RSS.

#### Refresh

One-time update of displayed values.

#### Start, Stop

Use the Start button to start automatic update of displayed values with a period of 1 second. Use the Stop button to stop it.

### RX constellation diagram

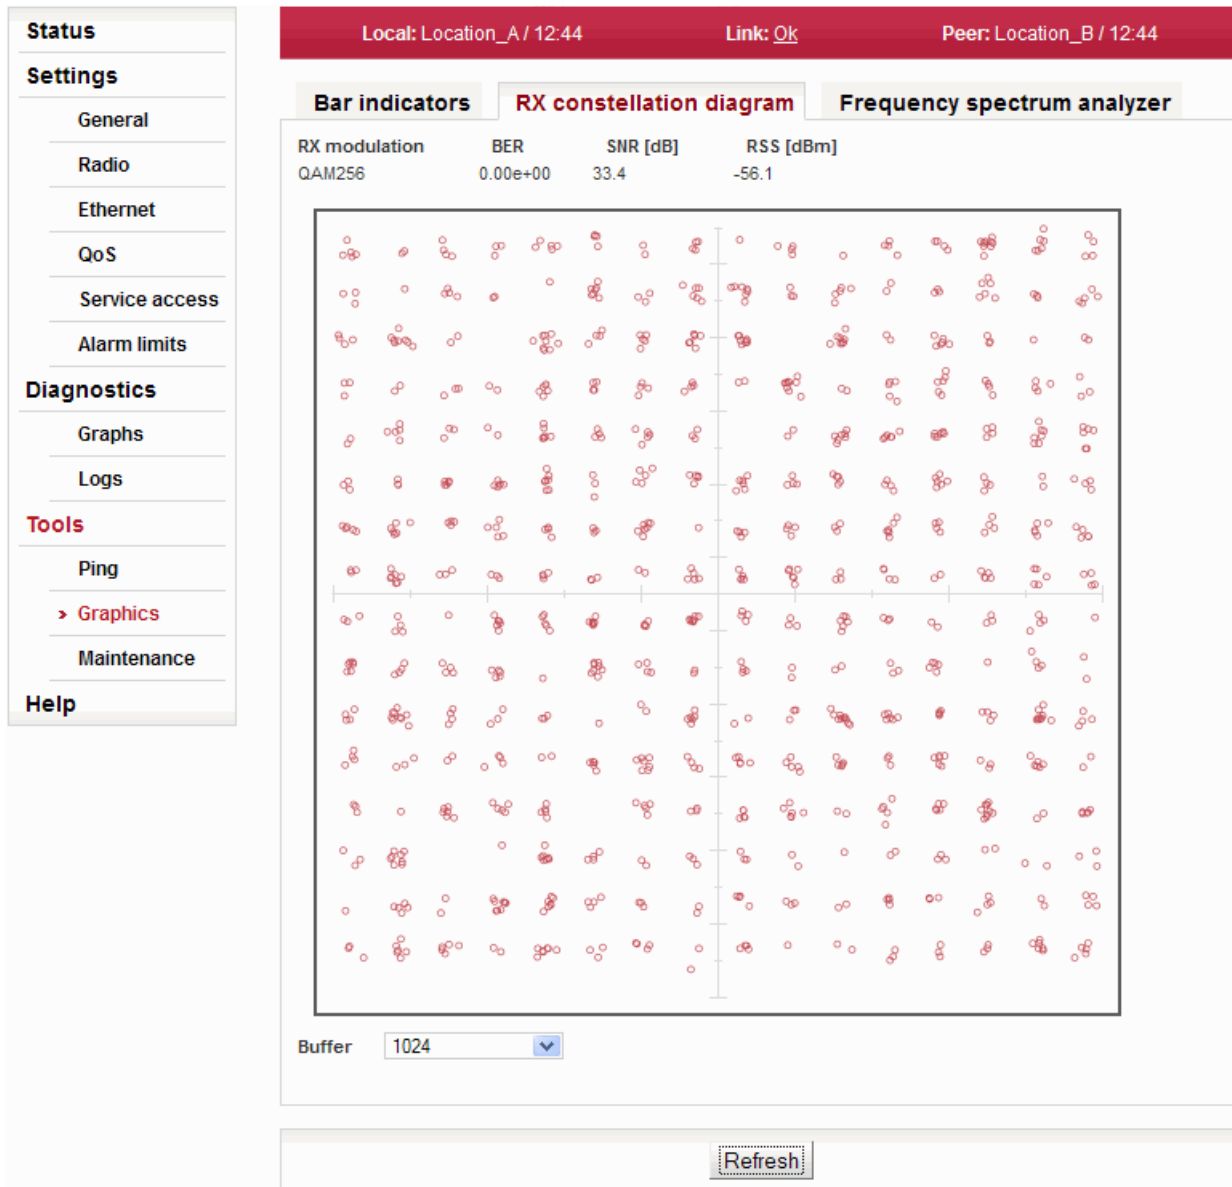

Fig. 6.23: Configuration menu Tools – Graphics – RX constellation diagram

Constellation diagram shows the quality of received signal.

**Buffer**                      Number of plotted points.

**Refresh**                    One-time update of diagram.

## Frequency analyser

Fig. 6.24: Configuration menu Tools – Graphics – Frequency analyser

A very useful tool for identifying in-band interference and locating a free channel. It is not a full-blown spectrum analyser as it scans the spectrum with 7MHz channel resolution. The accuracy of measured results is given by the accuracy of measuring RSS.

### Warning

Running spectrum measurement causes interruption of user data flow between stations!

**Spectrum measure time** Selection of measurement length in range:  
single sweep ... up to 15 min

**Mute peer TX** The deactivation of Peer station transmission during measurement.

**Enable** Opening analyser functions

**Start** Interrupts communication on the link and starts scanning frequencies in the band.

### 6.5.3. Tools – Maintenance

#### ■ Restart

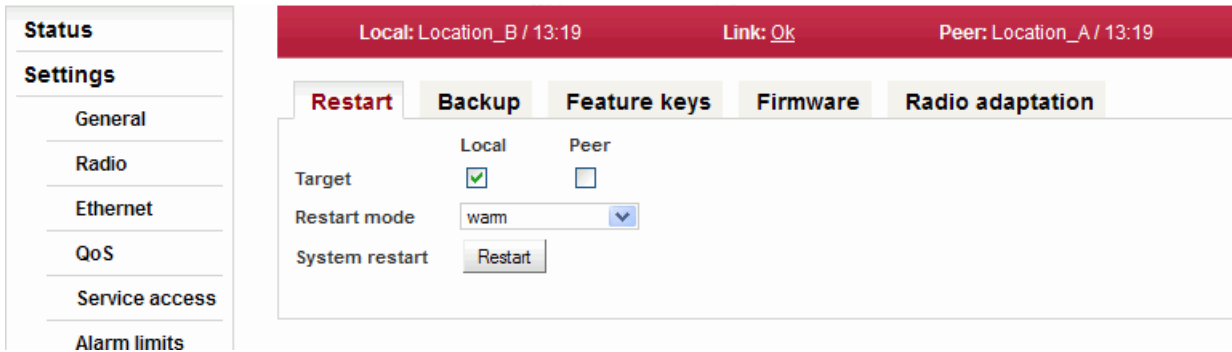

Fig. 6.25: Configuration menu Tools – Maintenance – Restart

<b>Target</b>	Restart of selected unit, Local or Peer.
<b>Restart mode</b>	Warm – reboot management system. Cold – restart the whole station as if power was removed.
<b>System restart</b>	Performs the selected restart.

#### ■ Backup

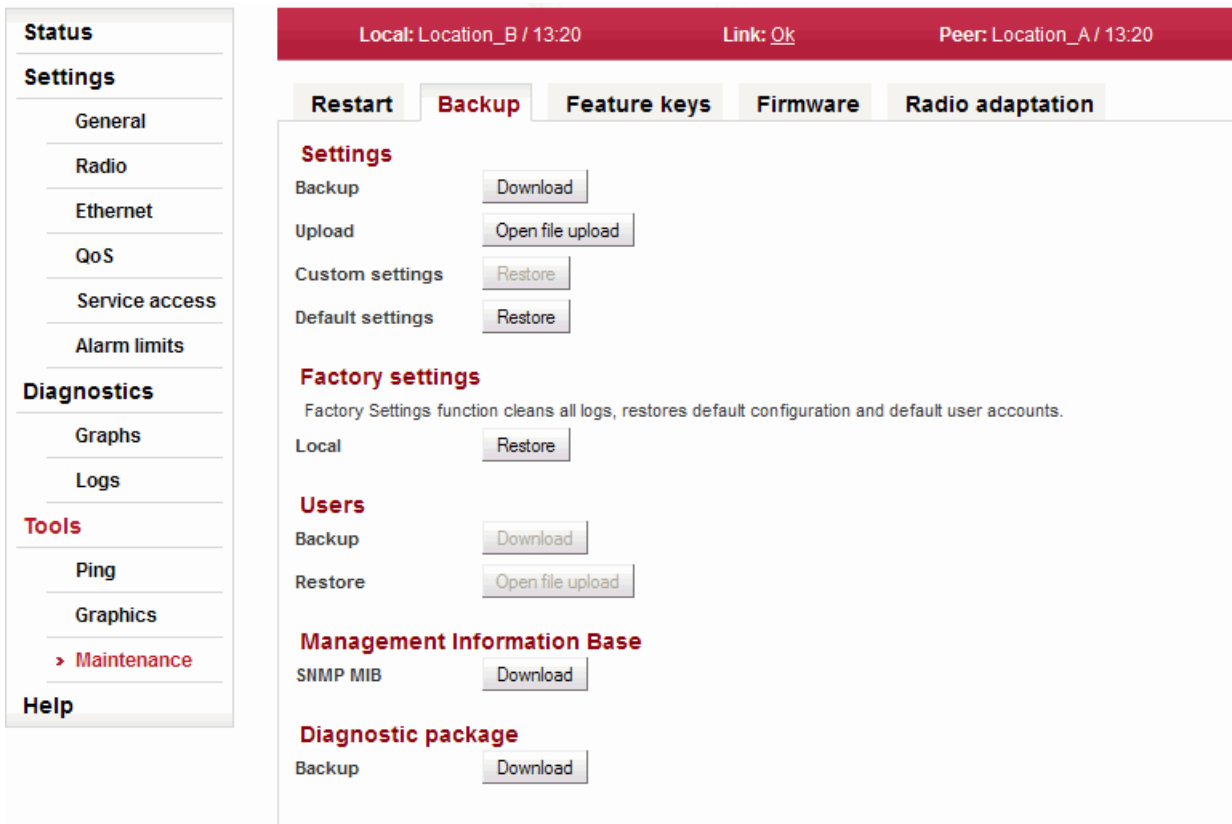

Fig. 6.26: Configuration menu Tools – Maintenance – Backup

## Settings

Saving and restoring configuration.

<b>Backup</b>	Saving configuration to backup file.
<b>Upload</b>	Upload configuration from a backup file into buffer. RAY continues to run with the current configuration.
<b>Custom settings</b>	Restoring the configuration parameters from the buffer. Parameters must be prepared using <i>Upload</i> .
<b>Default settings</b>	Applying default values to all configuration parameters.

## Factory settings

Using the factory settings function will return the unit to its original state. All configuration items, user accounts, measured values and system messages (logs) will be irreversibly deleted.

### Warning

This task takes a few minutes to complete. Do not interrupt the power supply during the operation.

<b>Local</b>	Applying Factory settings to Local station.
--------------	---

## Users

Saving and restoring user accounts.

<b>Backup</b>	Saving user accounts to backup file.
<b>Restore</b>	Restoring user accounts from a backup file.

## Management Information Base

<b>SNMP MIB</b>	Provides MIB table.
-----------------	---------------------

## Diagnostic package

To facilitate communication with the technical support you can create an archive file with detailed information about the station. If connection with Peer station is functional, information from both stations is saved.

<b>Backup</b>	Saving a file with information about the station (Local and Peer).
---------------	--

■ Feature keys

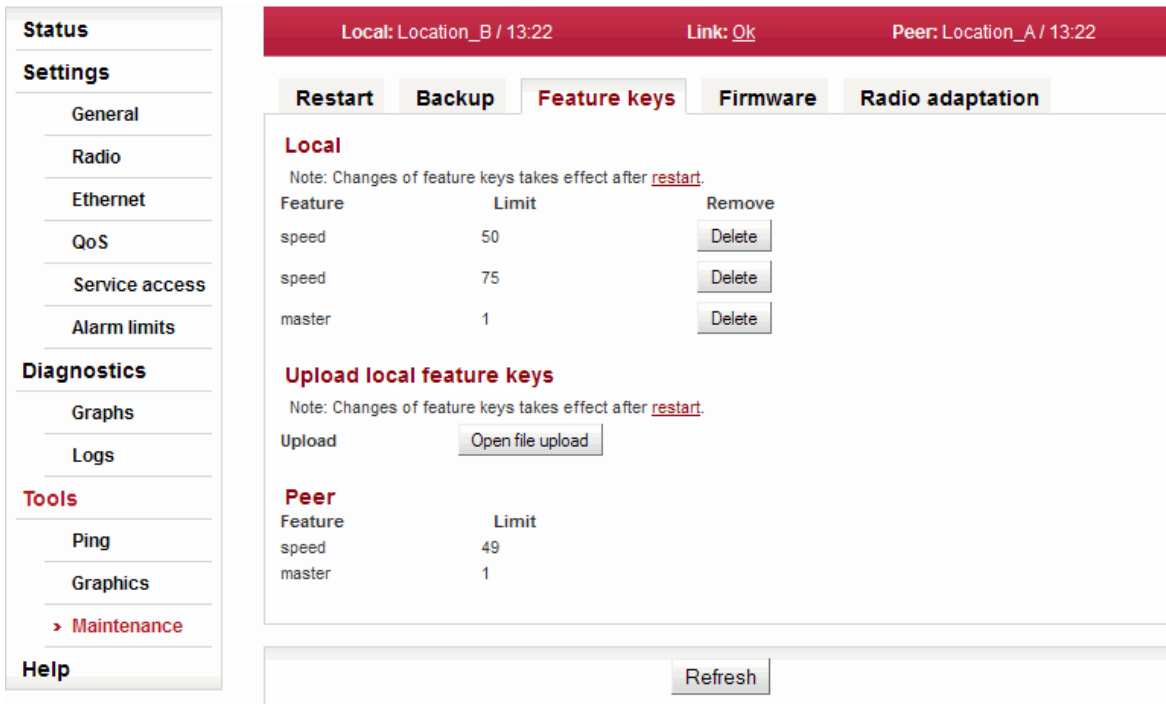

Fig. 6.27: Configuration menu Tools – Maintenance – Firmware

The sub-set of RAY parameters is affected by use of Feature keys. The feature keys limiting data transfer speed [Mbps] are now available. Speed of the transferred data is determined by a combination of the radio channel bandwidth (parameter Bandwidth [MHz]) and modulation order (parameter TX modulation). The Feature key limiting the data transfer speed enables only certain combinations of the channel bandwidth and modulation order to get the data transfer speed according to the Feature key. The data transfer speed is typically slightly higher than declared.

When installed, the Feature key is activated after the **station restart**. The station can be restarted using the *Tools-Maintenance-Restart* menu. Choose the *warm Restart* mode.

**Local**

The active Feature keys in the Local station.

- Feature** Name of the function controlled by the Feature key.
- Limit** The numeric value set by the key.
- Remove** The specific Feature key can be deleted using the Delete button. The parameters controlled by this Feature key are reset to their default values after the station restart.  
Note: The link radio parameters can be changed subsequently (e.g. to a different operating frequency)!
- Upload local feature keys** Feature keys are installed into the station from the binary files.
- Open file upload** Dialog for the Feature key binary file selection is open.

## Peer

Peer station active Feature keys. Feature keys of the Peer station are only displayed. They can be neither added, nor deleted. To be able to manipulate the Feature keys, it is necessary to access directly management interface of the relevant station - use the IP address of the relevant station.

**Feature** Name of the function controlled by the Feature key.

**Limit** The numeric value set by the key.

## ■ Firmware

The screenshot shows the 'Firmware' configuration page. At the top, there's a status bar with 'Local: Location\_A / 08:14', 'Link: Ok', and 'Peer: Location\_B / 08:14'. Below this are tabs for 'Restart', 'Backup', 'Feature keys', 'Firmware', and 'Radio adaptation'. The 'Firmware' tab is active. It contains a 'Warning' section stating 'Upgrading to a wrong firmware may result with malfunctional station.' Below the warning is a 'Firmware upgrade' section with a table:

	Local	Peer
Current version	0.1.16.0	0.1.16.0
Version in buffer	n/a	n/a

Below the table is a 'Clean buffer' button. Underneath is the 'Firmware upload' section with fields for 'File name' (n/a) and 'File size [B]' (n/a), and an 'Open file upload' button. At the bottom of the main content area are 'Upgrade' and 'Refresh' buttons.

Fig. 6.28: Configuration menu Tools – Maintenance – Firmware

If a new firmware version is released for the given microwave link type, you can upload it to your RAY units.

## Firmware upgrade

**Current version** Information about the current firmware version on Local and Peer station.

**Version in buffer** Information about firmware version prepared in the buffer for installation into the unit (Local, Peer). This firmware must first be prepared in the Firmware upload section (see below).

**Clean buffer** You can use the Clean buffer button to delete prepared firmware package in the buffer.

## Firmware upload

**File name** Name of the firmware file

**File size [B]** Size of the firmware file

**Open file upload**

Opens a dialog for uploading firmware package to the unit buffer. Only after firmware has been prepared in the buffer, you can perform the actual upgrade.

**Upgrade**

Use the *Upgrade* button on the bottom bar to perform the firmware installation.

**Warning**

Installing the firmware takes several minutes (about 10 minutes). During this time, transmission of user data is interrupted (for about 8 minutes). Do not interrupt the power supply during firmware installation!

■ **Radio adaptation**

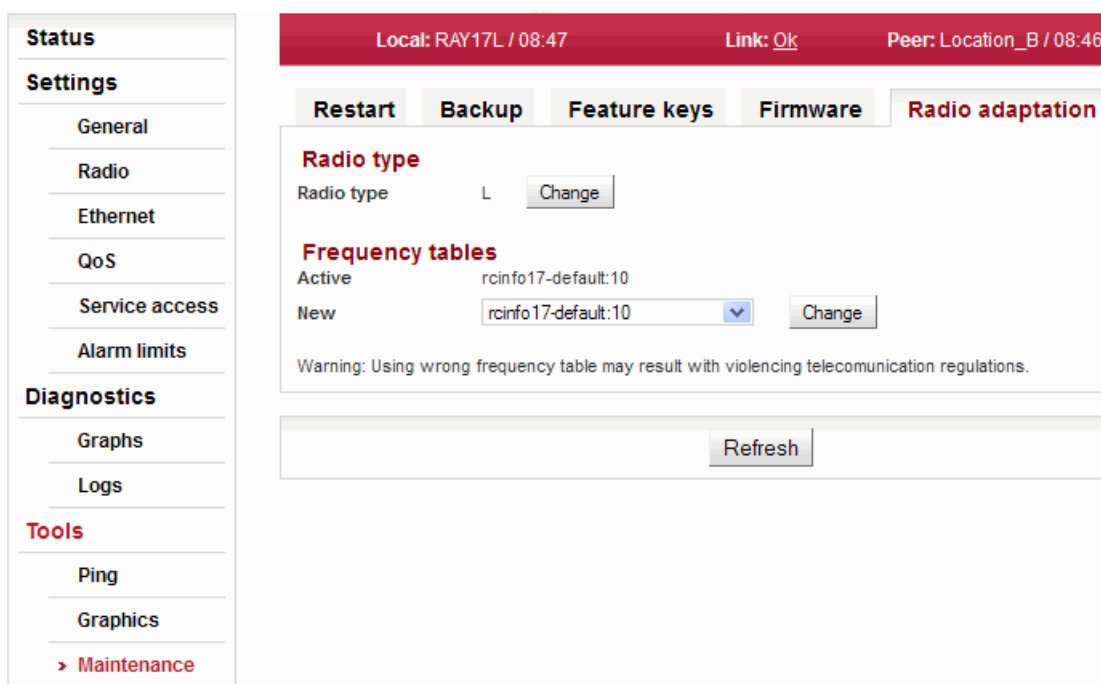

Fig. 6.29: Configuration menu Tools – Maintenance – Radio adaptation

**Radio type**

**Important**

Applies only to links operating in the ISM band (RAY17, RAY24).

Hardware of these links is universal for the entire frequency band. To facilitate the configuration of radio parameters, units are coded for L (Lower) and U (Upper) part of the band. L or U band assignment can be modified.

**Radio type**

Radio unit type: L (Lower) or U (Upper) part of the frequency band. Use the *Change* button to change the radio type.

## Frequency tables

The microwave link contains one or more frequency tables. These tables contain the following information:

- List of available bandwidths and modulations.
- Assignment of frequencies to the channels and the names of these channels. These channels are used to configure radio parameters of the link (see screen Settings-Radio).
- Default values of radio parameters.
- A set of radio parameters, needed for the ATPC operation.

<b>Active</b>	Name of the currently used frequency table.
<b>New</b>	Select a new frequency table. Use the <i>Change</i> button to change the table.

### Warning

Using the wrong frequency table can lead to violation of the corresponding telecommunications regulations.

## 6.6. Help

The Help screen displays contents of the embedded help. The help text is displayed in the whole configuration window. The text structure corresponds to individual configuration screens.

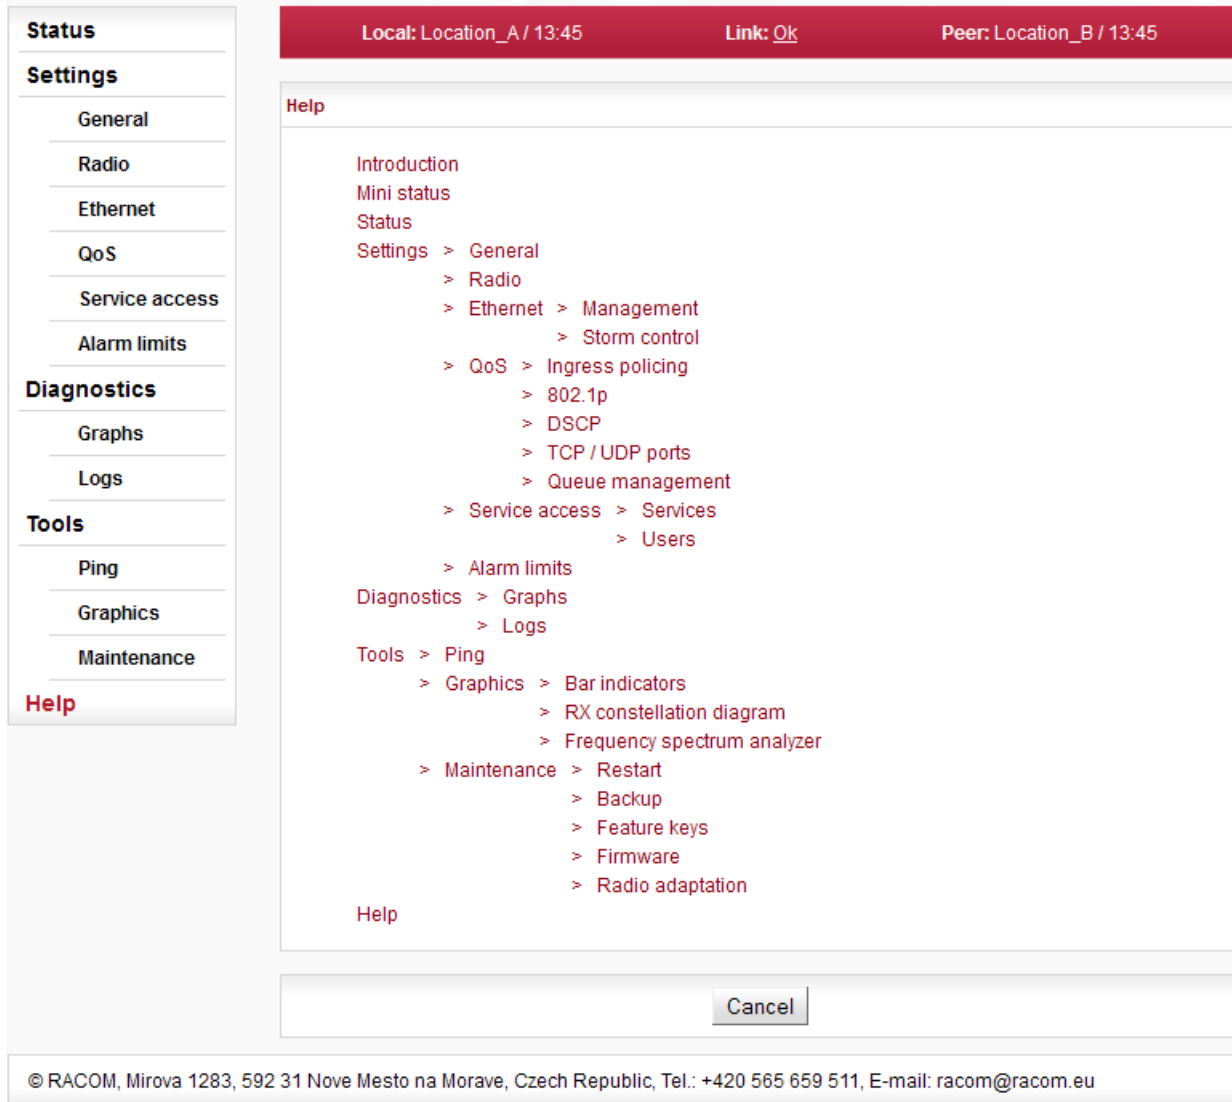

Fig. 6.30: Menu Help

Every item of this Help opens the specific menu help.

Clicking the name of the specific parameter in the configuration menu brings the help belonging to this parameter. The help text is displayed in the pop up window:

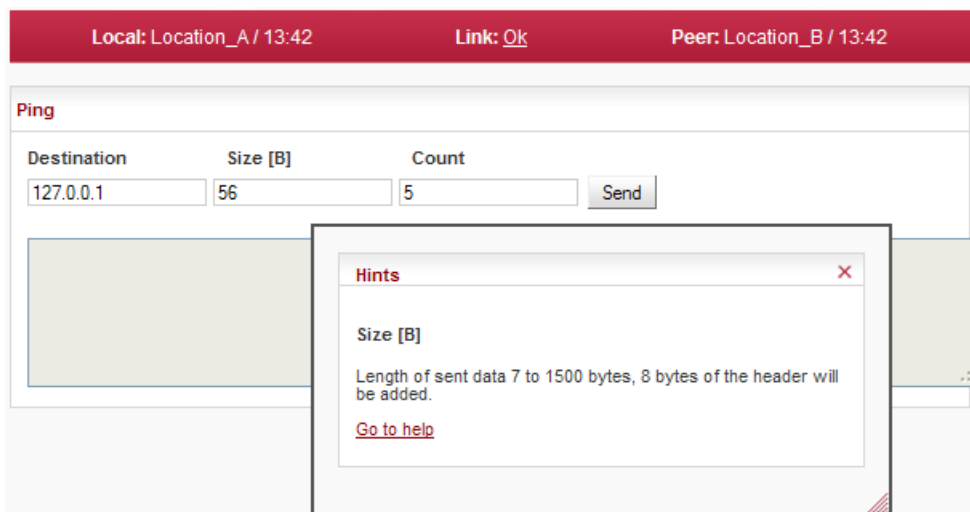

Fig. 6.31: Parameter help

The window can be moved by dragging the *Hints* bar. Resize it by dragging the bottom corner.

There is a *Go to help* link within the help text. The whole configuration menu help text is displayed by clicking this link:

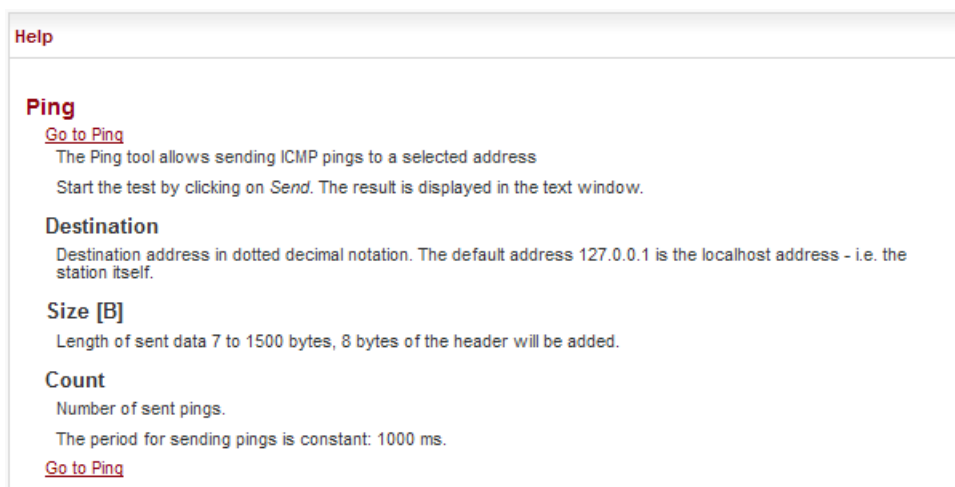

Fig. 6.32: Configuration menu help

There is a link at the beginning and end of each help screen which points to the respective configuration screen.

## 7. Command Line Interface

Command Line Interface (CLI) provides an alternative to HTTPS access. CLI allows you to work in text regime using a ssh (putty) or telnet client.

### 7.1. Connection via CLI

Using the **telnet** client to connect to unit with service IP address 192.168.169.169. Type this in the command prompt:

```
telnet 192.168.169.169
```

Then use the username and password from the menu `Service access/Users` for https access (by default `admin, admin`). Works if `Service access/Services/Telnet` is checked in https access.

Connection using **putty client**. Type this into the Host Name (or IP address) field:

```
admin@192.168.169.169
```

Click **Open**. Then enter the password `admin`. This procedure (without key) is subject to selection `Service access/Services/SSH` **on** in https access.

If you own the private key part, then you do not need a password. In putty, continue by selecting `Connection/SSH/Auth` and selecting path to file with key e.g. `key.ppk`. Use `Session/Logging` to save the putty configuration. To access the unit via CLI simply select the connection in putty and click **Open**.

Connection using client **ssh** in Linux.

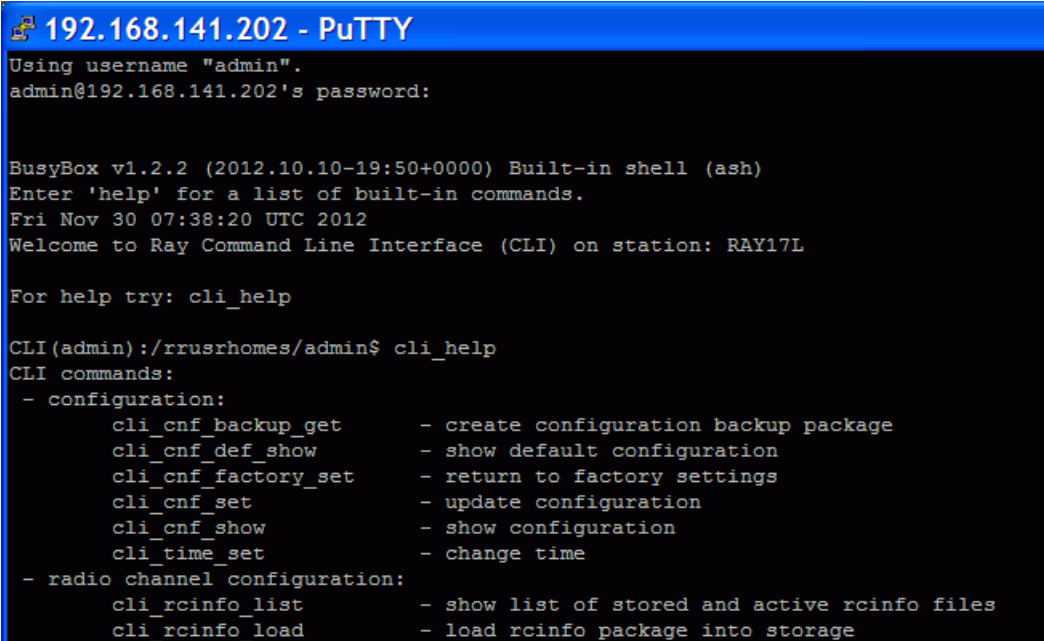

```
ssh admin@192.168.169.169 -i key
```

If you know the password and it is enabled in `Service access/Services/SSH` **onlykey** in https access, you can skip the key and use password in the next query.

## 7.2. Working with CLI

- Overview of CLI options

cli\_help

```

192.168.141.202 - PuTTY
Using username "admin".
admin@192.168.141.202's password:

BusyBox v1.2.2 (2012.10.10-19:50+0000) Built-in shell (ash)
Enter 'help' for a list of built-in commands.
Fri Nov 30 07:38:20 UTC 2012
Welcome to Ray Command Line Interface (CLI) on station: RAY17L

For help try: cli_help

CLI(admin):/rrusrhomes/admin$ cli_help
CLI commands:
- configuration:
  cli_cnf_backup_get      - create configuration backup package
  cli_cnf_def_show        - show default configuration
  cli_cnf_factory_set     - return to factory settings
  cli_cnf_set             - update configuration
  cli_cnf_show            - show configuration
  cli_time_set            - change time
- radio channel configuration:
  cli_rcinfo_list         - show list of stored and active rcinfo files
  cli_rcinfo_load         - load rcinfo package into storage

```

Fig. 7.1: CLI menu

- Parameters of CLI commands are listed in the help. For example:
  - h help listing
  - t target unit
  - t l local, default option
  - t b both, both units, command item for remote unit has PEER\_ prefix
  - t p peer, opposite unit, when reading using the show command
- When inserting commands, adding with tabulator can help
- Incorrect command is rejected (e.g. inserting forbidden frequency)
- Parameter that caused the loss of the connection is restored after 1 minute (Rollback)
- Reading parameters of local unit
 

```
cli_cnf_show
```
- Reading radio parameters of peer unit
 

```
cli_cnf_show -t p | grep RADIO
```
- Entering parameters (TX power of local unit)
 

```
cli_cnf_set RADIO_TX_PWR=-3
```

 Items of command (RADIO\_TX\_PWR=) are taken from the list cli\_cnf\_show

- Entering more parameters in both units  
`cli_cnf_set -t b RADIO_TX_CHAN=17128000 PEER_RADIO_RX_CHAN=17128000`
- Put parameters containing space in quotation marks:  
`cli_time_set -t b -T '2012-11-27 10:55:00'`  
Set time in both units

### 7.2.1. SSH keys

- Generation using ssh-keygen  
`[user@laptop ~]$ ssh-keygen -t dsa -f usr_ssh_key`  
Uses working directory to save private `usr_ssh_key` and public part of the key `usr_ssh_key.pub`
- Copying the key into the RAY unit  
`[user@laptop ~]$ scp usr_ssh_key.pub admin@192.168.141.202:/tmp`  
The public part of the key is written to the folder `/tmp`
- Installation of key in RAY unit  
`CLI(admin):/rrusrhomes/admin$ cli_user_authkey -c a -k /tmp/usr_ssh_key.pub`
- Test of access to RAY unit using SSH key  
`[user@laptop ~]$ ssh -i usr_ssh_key admin@192.168.141.202`

### 7.2.2. Scripts

- Script example with access using key

```
[user@laptop ~]$ ssh -i usr_ssh_key admin@192.168.141.202
"source /etc/profile;cli_info_link;echo \ $?;cli_cnf_show | grep TX_PWR;echo $?"
Warning: Permanently added '192.168.141.202' (DSA) to the list of known hosts.
cli_info_link: Link status: up
0
RADIO_TX_PWR=4
0
[user@laptop ~]$
```

- The script contains:

<code>source /etc/profile;</code>	environment settings
<code>cli_info_link;</code>	query for link status
<code>echo \ \$?;</code>	reading return value
<code>cli_cnf_show   grep TX_PWR;</code>	query for radio power
<code>echo \ \$?</code>	reading return value
<code>cli_info_link: Link status:up</code>	return value
<code>0</code>	OK command
<code>RADIO_TX_PWR=4</code>	power +4 dBm
<code>0</code>	OK command

## 7.3. Configuration with CLI

### 7.3.1. Configuration file

- Configuration backup  
`cli_cnf_backup_get`  
 Saves the configuration of both units to file `cnf_backup.tgz` into the working directory.
- Configuration restore  
`cli_cnf_set -t b -b cnf_backup.tgz`  
 Restores configuration of both units from file `cnf_backup.tgz`
- Default configuration - list  
`cli_cnf_def_show`  
 Attention, the command  
`cli_cnf_factory_set`  
 is not a default setting - it uses factory settings, deletes all logs and saved data. It is very likely that the connection to peer station will be interrupted!

### 7.3.2. Firmware upgrade

- Current version of fw  
`cli_info_station`
- Preparation of files  
 fw package, for example `bm4-RACOM-0.1.12.0.cpio` copy using ssh or putty into folder `/tmp` in RAY17  
 Command  
`cli_fw_clear_buffer`  
 Clears the RAY buffer  
`cli_fw_buffer_status`  
 Checks buffer status
- Saving into buffers  
`cli_fw_load_package -f /tmp/bm4-RACOM-0.1.12.0.cpio`  
 A new fw package is loaded into the buffer (20 sec)  
`cli_fw_upload2peer`  
 The fw package is also loaded into the peer unit (20 sec)
- Upgrade  
`cli_fw_upgrade -t b`  
 Firmware in both units will be replaced with new version from the buffer. After 3 minutes, this message appears:  

```
Firmware upgrade started. Estimated time to finish is 370 s.
```

 Connection is terminated. After a few minutes, log in to RAY again

### 7.3.3. Remote unit authorization

The RAY unit in default configuration, establishes a connection with any remote unit and both units act as a communication pair. Should the higher protection from the unauthorized communication take-over be required, it is possible to use so called Secured mode of remote unit authorization. This mode is based on locking the two specific units into one communication pair. The units with Secured mode

activated refuse to make a connection with any other communication unit. The units are locked using the unique authorization keys. The keys are exchanged between the affected units. The authorization keys can be backed up to an external medium to be able to make a service unit exchange, if necessary.

The Secured mode set up process consists of a few steps:

- Unique authorization keys generation:

```
cli_link_key_gen -t b
```

- Authorization keys exchange between the two communication units:

```
cli_link_key_swap
```

- Authorization keys activation:

```
cli_link_key_apply -t b
```

Parameter `-t` determines, whether we configure the whole link (`-t b`) or only one unit (`-t 1`).

- Secured mode activation. Both sides of the link has to have identically secured mode set On or Off:

```
cli_cnf_set -t b SVC_SECURE_PEER_MODE=on PEER_SVC_SECURE_PEER_MODE=on
```

- Secured mode de-activation:

```
cli_cnf_set -t b SVC_SECURE_PEER_MODE=off PEER_SVC_SECURE_PEER_MODE=off
```

- Backup of the keys to an external medium. The backup has to be performed to be able to make service exchange of the corrupted unit, if necessary. The new exchanged unit is not able to make an active connection with the other unit if it is not loaded with the proper authorization key.

```
cli_link_key_save -s s -f <file>
```

The key is backed up to selected file in the internal unit file system. It can be transferred to an external medium for example using the scp client.

- Authorization key restoration from the external medium.

The key has to be transferred to the unit internal file system first. Scp client can be used. The CLI commands can be applied subsequently:

```
cli_link_key_load -t b -f <file>
```

```
cli_link_key_apply -t b
```

## 8. Troubleshooting

- **Polarization incorrect**

To receive the *horizontal* or *vertical* message for TX the transmission axis must be horizontal, the handgrip must be either horizontal or vertical and the connectors must point downward at an angle. Each unit is evaluated separately.

- **The link cannot be established**

Start with the most “resilient” configuration. This configuration depends on the type of unit. We recommend to use the narrowest available bandwidth (e.g. 3.5 MHz), the lowest modulation level (QPSK) and maximum available output power. TX and RX channels must be the same as the RX and TX channels in the remote unit. When the connection has been established and the antennas have been directed, continue to operation parameters.

The units operating in licensed bands (RAy10, RAY11) are mounted with the same TX polarization (both unit handles horizontally or both vertically).

The units working in ISM band (RAY17, RAY24) must be mounted one with TX horizontal polarisation (horizontal handle) and the second with TX vertical polarisation (vertical handle).

- **Access to the Local unit is blocked**

Access to the Local unit may be accidentally blocked, for instance by disabling HTTPS access. If you can access the Remote unit over HTTPS, type its address in your web browser's address field. The link will transfer the packet over the Local unit with blocked service access all the way to the Remote unit, which will give you access to the control menus of both units. Attention, the Remote unit will report as Local.

- **Distinguishing Local-Remote**

The unit accessed via service access always reports as Local. If you connect through another (peer) unit and radio channel, certain amount of caution is necessary. For example, not to reduce the transmission power so that the link interrupts accidentally. Errors of this type should be fixed by rollback function within approx. 1 minute.

Resolution can be done by comparing the length of ping on Local and Remote. Pinging the unit behind the radio channel is slower. The difference is more pronounced in case of a long packet and the low speed of the radio channel.

- **Access security**

For better protection against unauthorised access to configuration you should only allow as few kinds of access as possible. The most secure type is SSH with key – leave only SSH checked.

- **RSS**

To configure the link and monitor its state, several menus display the RSS signal strength. Please keep in mind, that Ray is not a measuring instrument, hence the precision of the RSS reading is limited. Though in most situations the RSS reading accuracy is better than  $\pm 2$ dB, the absolute RSS value should not be used for accurate comparisons e.g. between two links.

- **Problem with https certificate**

See the Appendix E, *Https certificate*

## 9. Technical parameters

The RAY10 basic technical parameters are stated here for clarity. The *RAY10 User manual* can be found here<sup>1</sup>.

### 9.1. General parameters

#### 9.1.1. Technical parameters overview

Type	Licensed bands		ISM bands	
	RAY10	RAY11	RAY17	RAY24
Band [GHz] sub-bands A,B..	A: 10.30 – 10.59 B: 10.15 – 10.65	A,B: 10.70 – 11.70 C,D: 10.50 – 10.68	17.1 – 17.3	24.0 – 24.25
ODU inits	Unit L and U		One universal unit	
Duplex spacing [MHz]	any combination L and U units	A,B: 490, 530 C,D: 91	optional min 60	optional min 60
Channel spacing CS [MHz]	7, 14, 28	1.75, 3.5, 7, 14, 28, 30, 40, 56	3.5, 7, 14, 28, 40, 56	3.5, 7, 14, 28, 40, 56
Channel frequencies	detail <sup>2</sup>	detail	detail	detail
User speed [Mbps]	8.5 – 170 detail <sup>3</sup>	2.5 – 360 detail	4.9 – 360 detail	4.9 – 360 detail
Latency [μs]	140 (64B/170Mbps)	81 (64B/359Mbps), 234 (1518B/359Mbps)		
Sensitivity, BER 10 <sup>-6</sup> [dBm]	-96 (8.5 Mbps) -69 (166 Mbps) detail <sup>4</sup>	-99 (2.5 Mbps) -67 (340 Mbps) detail	-96 (4.9 Mbps) -66 (340 Mbps) detail	-96 (4.9 Mbps) -65 (340 Mbps) detail

### 9.1.3. Duplex spacing

Duplex spacing L and U channels			
<b>RAy10</b>			
Sub-bands			
A	All combinations of channels		
B	All combinations of channels		
<b>RAy11</b>			
Sub-bands	Duplex spacing [MHz]		
A, B	490, 530		
C,D	91		
<b>RAy17</b>			
	Optional duplex spacing		
Channel width	minimum	default	maximum
[MHz]	[MHz]	[MHz]	[MHz]
3.5	60	73.5	192.5
7	60	73.5	192.5
14	65	87.5	185.5
28	70	87.5	171.5
40	70	73.5	157.5
56	85	87.5	143.5
<b>RAy24</b>			
	Optional duplex spacing		
Channel width	minimum	default	maximum
[MHz]	[MHz]	[MHz]	[MHz]
3.5	60	73.5	241.5
7	60	73.5	238.0
14	65	87.5	234.5
28	70	87.5	220.5
40	70	73.5	206.5
56	85	87.5	192.5

ver. 2.2

### 9.1.4. Frequency overview 10 GHz and 11 GHz, for CS 28 MHz

ver. 2.0

### 9.1.5. Nominal frequency tables description

<b>RAY11 – xA , RAY11 – xB</b> <sup>1)</sup>			TX channel nominal frequencies		
Bandwidth: <b>56 MHz (CS 80)</b> <sup>2)</sup>			Band 10.7 – 11.7 GHz, <sup>3)</sup> duplex frequency 490 MHz <sup>4)</sup>		
A sub-band <sup>6)</sup> (Freq.table: rcinfo11_A_490, rcinfo11_A_490_n) <sup>7)</sup>			B sub-band (Freq.table: rcinfo11_B_490, rcinfo11_B_490_n)		
Ch.No.	Lower [MHz]	Upper [MHz]	Ch.No.	Lower [MHz]	Upper [MHz]
1 <sup>8)</sup>	10755 <sup>9)</sup>	11245 <sup>10)</sup>	7	10995	11485
2	10795	11285	8	11035	11525
3	10835	11325	9	11075	11565
4	10875	11365	10	11115	11605
5	10915	11405	11	11155	11645

ver. 1.0 11)

- 1) The respective RAY unit name. The letter “x” stands for “L” or “U” (Lower or Upper band unit).  
Example: “RAY11-xA” means both “RAY11-LA” and “RAY11-UA” units. See overview table for details.  
  
Note: The optional last figure in the unit name (e.g. RAY11-LA-2) denotes number of Ethernet ports and it is not relevant for the Nominal frequency tables.
- 2) The respective channel set (nominal frequencies) name in the Ray unit configuration interface (see Configuration, item “Bandwith [MHz]”. In addition to the bandwidth definition, the name may contain additional text which defines the respective alternative of channel plan.  
  
Examples: “Bandwith: 40 MHz (ITU)” means that the nominal frequencies in the table follow the recommendation ITU-R F.387 rec.1.2. for 40 MHz bandwidth, see also the note 5) below.  
  
“Bandwith: 40 MHz (ACMA)” means that the table describes the 40 MHz channel plan defined by ITU-R F.387 rec. 1.1. (b), applied e.g. in Australia.
- 3) The whole frequency range.
- 4) Duplex spacing – the frequency difference between the Upper and Lower channels in a duplex pair.
- 5) The name of standard or recommendation defining the respective channel plan.
- 6) Name of the sub-band defined by channels in the table.
- 7) Name of the “Frequency table” containing the channel set described (see Configuration, item “Frequency tables”).
- 8) The channel number according to RAY unit configuration interface (see Configuration, item “TX channel [GHz]”).
- 9) The nominal TX frequency of the Lower-band channel
- 10) The nominal TX frequency of the Upper-band channel.
- 11) Table version.

## 9.2. RAY11 A,B parameters

### 9.2.1. Output power

RAY11-xA, RAY11-xB	TX power	
	Max [dBm]	Min [dBm]
QPSK	23	-5
16-QAM	20	-5
32-QAM	19	-5
64-QAM	18	-5
128-QAM	18	-5
256-QAM	17	-5

ver. 2.0

## 9.2.2. Radio parameters

## 10. Safety, environment, licensing

### 10.1. Frequency

RAy microwave links designed for operation in licensed bands must be used in accordance with license issued by the Telecommunications Authority for the area the device is operating in.

RAy microwave links designed for operation in ISM bands must comply with the maximum permitted radiated power (EIRP) in accordance with conditions of the given country.

### 10.2. RoHS and WEEE compliance

The RAY is fully compliant with the European Commission's RoHS (Restriction of Certain Hazardous Substances in Electrical and Electronic Equipment) and WEEE (Waste Electrical and Electronic Equipment) environmental directives.

**RoHS**  Restriction of hazardous substances (RoHS)

The RoHS Directive prohibits the sale in the European Union of electronic equipment containing these hazardous substances: lead, cadmium, mercury, hexavalent chromium, polybrominated biphenyls (PBBs), and polybrominated diphenyl ethers (PBDEs).

End-of-life recycling programme (WEEE)

The WEEE Directive concerns the recovery, reuse, and recycling of electronic and electrical equipment. Under the Directive, used equipment must be marked, collected separately, and disposed of properly. Racom has instigated a programme to manage the reuse, recycling, and recovery of waste in an environmentally safe manner using processes that comply with the WEEE Directive (EU Waste Electrical and Electronic Equipment 2002/96/EC).

**Battery Disposal**—This product may contain a battery. Batteries must be disposed of properly, and may not be disposed of as unsorted municipal waste in the European Union. See the product documentation for specific battery information. Batteries are marked with a symbol, which may include lettering to indicate cadmium (Cd), lead (Pb), or mercury (Hg). For proper recycling return the battery to your supplier or to a designated collection point. For more information see: [www.weeerohsinfo.com](http://www.weeerohsinfo.com)

### 10.3. Conditions of Liability for Defects and Instructions for Safe Operation of Equipment

Please read these safety instructions carefully before using the product:

- Liability for defects does not apply to any product that has been used in a manner which conflicts with the instructions contained in this operator manual, or if the case in which the radio modem is located has been opened, or if the equipment has been tampered with.
- The radio equipment can only be operated on frequencies stipulated by the body authorised by the radio operation administration in the respective country and cannot exceed the maximum permitted output power. RACOM is not responsible for products used in an unauthorised way.

- Equipment mentioned in this operator manual may only be used in accordance with instructions contained in this manual. Error-free and safe operation of this equipment is only guaranteed if this equipment is transported, stored, operated and controlled in the proper manner. The same applies to equipment maintenance.
- In order to prevent damage to the radio modem and other terminal equipment the supply must always be disconnected upon connecting or disconnecting the cable to the radio modem data interface. It is necessary to ensure that connected equipment has been grounded to the same potential.
- Only undermentioned manufacturer is entitled to repair any devices.
- Should the RAY unit be used with accessories other than those recommended, Racom takes no responsibility for any malfunction caused by the use of such accessories. Using unsuitable accessories (e.g.cable connectors) can result in a mechanical damage to RAY internal connectors, allow the penetration of water inside the unit, or reduce the efficiency of internal surge protection circuits.

## 10.4. Important Notifications

Sole owner of all rights to this operating manual is the company RACOM s. r. o. (further in this manual referred to under the abbreviated name RACOM). All rights reserved. Drawing written, printed or reproduced copies of this manual or records on various media or translation of any part of this manual to foreign languages (without written consent of the rights owner) is prohibited.

RACOM reserves the right to make changes in the technical specification or in this product function or to terminate production of this product or to terminate its service support without previous written notification of customers.

Conditions of use of this product software abide by the license mentioned below. The program distributed by this license has been freed with the purpose to be useful, but without any specific guarantee. Under any circumstances the author or another company or person is not responsible for secondary, accidental or related damages resulting from application of this product.

The producer does not provide the user of any kind of guarantee containing assurance of suitability and usability for his application. Products are not developed, designed nor tested for utilization in devices directly affecting health and life functions of persons and animals, nor as a part of another important device, and does not provide of guarantees if the company product has been used in these aforementioned devices.

---

### RACOM Open Software License

Version 1.0, November 2009

Copyright (c) 2001, RACOM s.r.o., Mírová 1283, Nové Město na Moravě, 592 31

Everyone can copy and spread word-for-word copies of this license, but any change is not permitted.

The program (binary version) is available for free on the contacts listed on <http://www.racom.eu>. This product contains open source or another software originating from third parties subject to GNU General Public License (GPL), GNU Library / Lesser General Public License (LGPL) and / or further author licences, declarations of responsibility exclusion and notifications. Exact terms of GPL, LGPL and some further licences is mentioned in source code packets (typically the files COPYING or LICENSE). You can obtain applicable machine-readable copies of source code of this software under GPL or LGPL li-

cences on contacts listed on <http://www.racom.eu>. This product also includes software developed by the University of California, Berkeley and its contributors.

---

## **10.5. Warranty**

RACOM-supplied parts or equipment ("equipment") is covered by warranty for inherently faulty parts and workmanship for a warranty period as stated in the delivery documentation from the date of dispatch to the customer. The warranty does not cover custom modifications to software. During the warranty period RACOM shall, on its option, fit, repair or replace ("service") faulty equipment, always provided that malfunction has occurred during normal use, not due to improper use, whether deliberate or accidental, such as attempted repair or modification by any unauthorised person; nor due to the action of abnormal or extreme environmental conditions such as overvoltage, liquid immersion or lightning strike.

Any equipment subject to repair under warranty must be returned by prepaid freight to RACOM direct. The serviced equipment shall be returned by RACOM to the customer by prepaid freight. If circumstances do not permit the equipment to be returned to RACOM, then the customer is liable and agrees to reimburse RACOM for expenses incurred by RACOM during servicing the equipment on site. When equipment does not qualify for servicing under warranty, RACOM shall charge the customer and be reimbursed for costs incurred for parts and labour at prevailing rates.

This warranty agreement represents the full extent of the warranty cover provided by RACOM to the customer, as an agreement freely entered into by both parties.

RACOM warrants the equipment to function as described, without guaranteeing it as befitting customer intent or purpose. Under no circumstances shall RACOM's liability extend beyond the above, nor shall RACOM, its principals, servants or agents be liable for any consequential loss or damage caused directly or indirectly through the use, misuse, function or malfunction of the equipment, always subject to such statutory protection as may explicitly and unavoidably apply hereto.

## 10.6. Declaration of Conformity

**Declaration of Conformity – RAY11**

- in accordance with **1999/5/EC** Directive of the European Parliament and of the Council of 9<sup>th</sup> of March 1999 on radio equipment and telecommunications terminal equipment and the mutual recognition of their conformity.

<b>Manufacturer:</b>	<b>RACOM</b>
<b>Address:</b>	<b>Mirova 1283, 592 31 Nove Mesto na Morave, Czech Republic</b>
<b>VAT:</b>	<b>CZ46343423</b>
<b>Product:</b>	<b>RAY11</b>
<b>Purpose of use:</b>	<b>Microwave IP Bridge</b>

**CE** **i**

**We, the manufacturer of the above mentioned product, hereby declare that:**  
all essential radio test suites have been carried out and that the above named product is in conformity to all the essential requirements of the European Union directive **1999/5/EC – ANNEX IV** for equipment working in mode listen before transmit (the technical documentation relevant to the abovementioned equipment can be made available for inspection on application to manufacturer);

**The Declaration of Conformity is based on the following documents:**

# Appendix B. Rain Zone Map

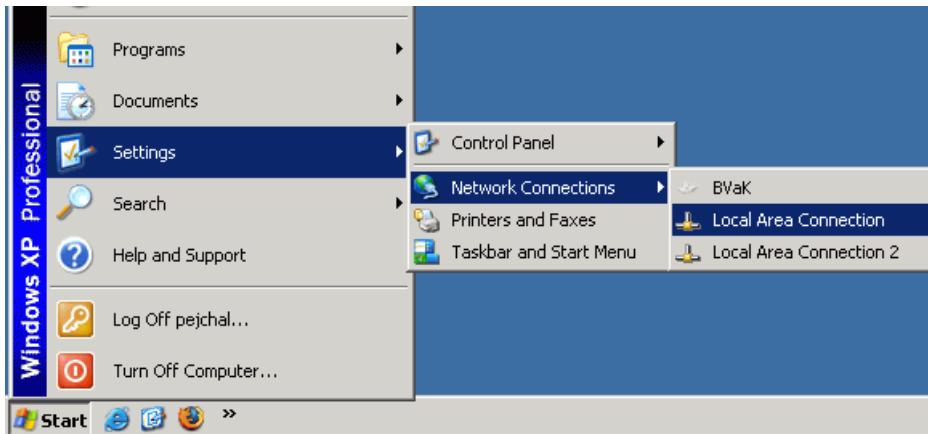

## Appendix C. IP address in the PC

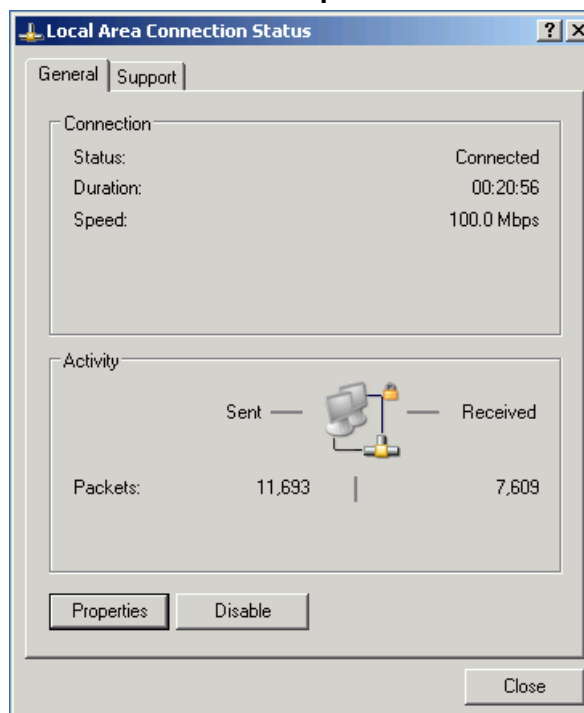

### Setting up the IP address in the PC

For configuration of the link a suitable IP address has to be set up in the PC, for example 192.168.1.233. In the next example for Windows XP we presume that the PC uses DHCP as the primary configuration.

- Open the Start menu, **Settings, Network Connections, Local Area Connection**

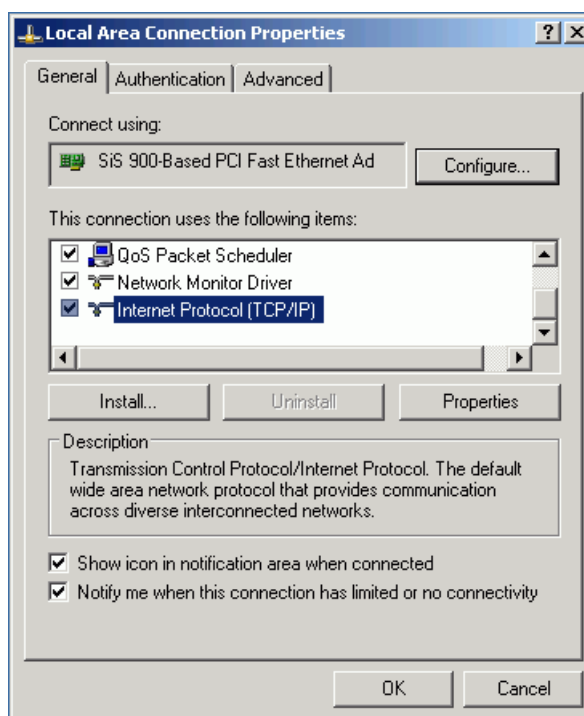

- In the window **Local Area Connection** select **Properties**

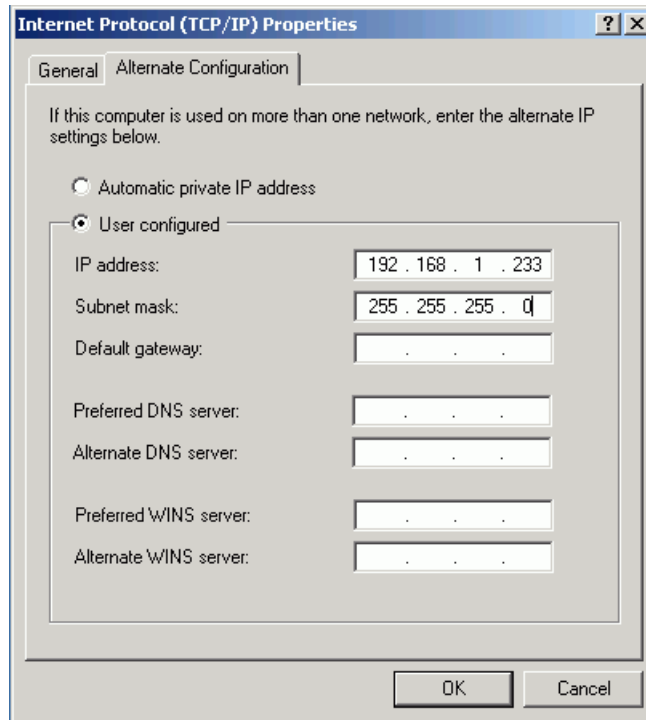

- Another window opens. Select **Internet Protocol (TCP/IP)** and click **Properties**

- Another window opens
- On the **General** tab select **Use the following IP address**
- Enter IP Address 192.168.1.233
- Set Subnet mask to 255.255.255.0
- Click **OK** to acknowledge this window and acknowledge the previous window in the same manner
- 
- The second option is to use automatic switching. In this case on the *General* tab select, for example *Obtain an IP address from the DHCP server automatically* and address 192.168.1.233 will be seen on the Alternate configuration tab. However, this detection and subsequent switching works slower and isn't entirely reliable.
- Select tab **Alternate configuration**
- Select **User defined configuration**
- Enter IP Address 192.168.1.233
- Set Subnet mask to 255.255.255.0

- Click **OK** to acknowledge this window and acknowledge the previous window in the same manner
- If you don't use Windows XP then proceed according to the manual when setting up the IP address.

### Checking the IP address in the PC

In Windows proceed in the following manner:

1. Open the Start menu and click **Run...**
2. Enter command **cmd**
3. Enter command **ipconfig** and read the PC IP address and mask:

```
C:\Documents and Settings\demo>ipconfig
Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : racom.cz
    IP Address. . . . .                : 192.168.1.233
    Subnet Mask . . . . .              : 255.255.255.0
    Default Gateway . . . . .          :
```

### Checking the PC - radio modem connection using Ping

In Windows send a ping as follows:

1. Check the connection between the PC and the radio modem via the Ethernet cable.
2. In the Start menu click **Run...**
3. Enter command **cmd**

4. Write **ping 192.168.1.2** and press OK
5. A message appears in a window:

```
C:\Documents and Settings\demo>ping 192.168.1.2
Pinging 192.168.1.2 with 32 bytes of data:
Reply from 192.168.1.2: bytes=32 time<1ms TTL=64
Reply from 192.168.1.2: bytes=32 time<1ms TTL=64
Reply from 192.168.1.2: bytes=32 time<1ms TTL=64
Reply from 192.168.1.2: bytes=32 time<1ms TTL=64
```

If no communication takes place a message appears with the text "Request timed out".

If communication between the web browser and radio modem doesn't take place check the browser settings. The *Work offline* item in the *File* menu cannot be crossed out.

## Appendix D. Linux key conversion

### Conversion Linux key – PuTTY

To use CLI (Command Line Interface) access the unit with a PuTTY client. Access is protected by a key supplied with the RAY link. The key is in Linux format and it begins:

```
-----BEGIN DSA PRIVATE KEY-----  
.....
```

or in PuTTY format which begins:

```
PuTTY-User-Key-File-2: ssh-dss  
.....
```

To convert the Linux format to PuTTY do the following:

In c:\Program Files\putty\ directory run PUTTYGEN.EXE

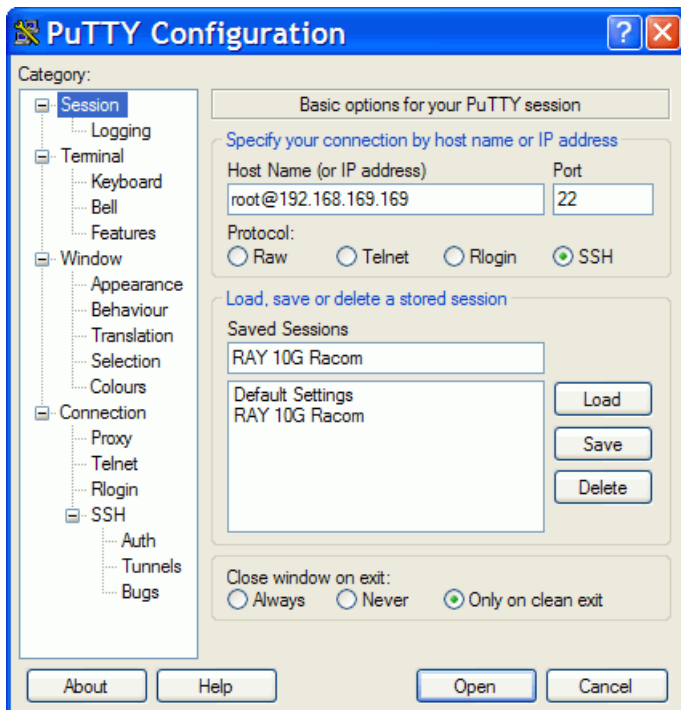

Click on “Load” and choose the private key supplied by the manufacturer.

In the next window type your password into the *Key passphrase* and *Confirm passphrase* fields. After that click *Save private key*.

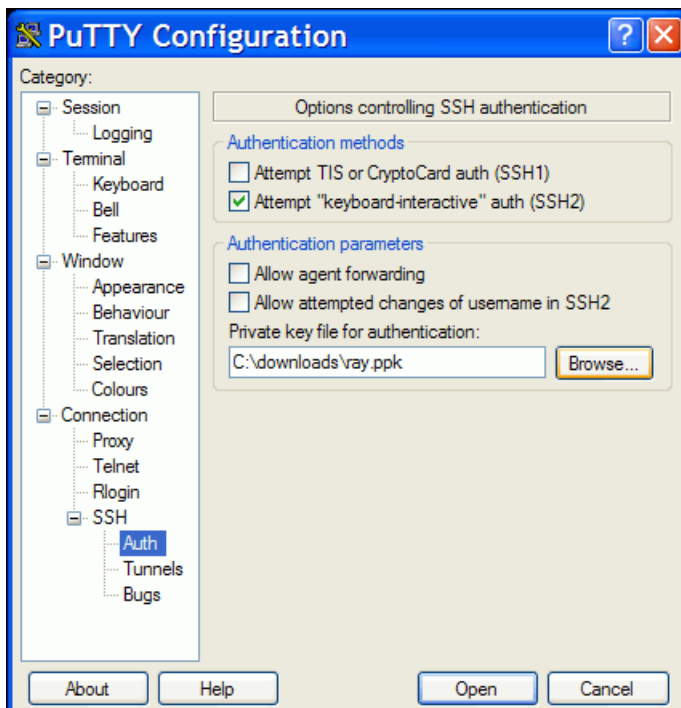

Choose location and save the key.

## PuTTY access with key

In PuTTY menu fill in the address, e.g. *root@192.168.169.169* and the name of the link, e.g. *RAy 17 Racom*.

Go to *Connection / SSH / Auth* in the left column and locate the key *C:\downloads\ray.ppk*

Go back to *Session* and *Save* the configuration.

To connect select the name of the connection and click *Open*. PuTTY asks for password created during key conversion.

## Appendix E. Https certificate

When switching from older versions of the firmware the access certificate for https was changed. The web browser configuration has to take place in order to remove link between microwave link management IP address and previous https certificate.

Mozilla Firefox how-to:

1. https certificate  
Remove management IP address from the list: Tools - Options - Advanced - Encryption - View Certificates - Servers  
Another possibility: remove certificate Racom "RAY" or Racom "RACOM's product" from the list: Tools - Options - Advanced - Encryption - View Certificates - Authorities
2. Upon the new RAY unit connection following message appear: "*This Connection is Untrusted*".
3. If you are sure that there is no security risk, choose: "*I Understand the Risks*".
4. The next step is "*Add Exception...*".
5. Finally, you have to "*Confirm Security Exception*". If the Apply button is not active, it is necessary to perform step No. 1/ and restart web browser.

Internet Explorer may give following message "*There is a problem with this website's security certificate*". Choose "*Continue to this website (not recommended)*". The address line gives you status information "*Certificate Error*". This inconvenience is caused by impossibility to create security certificate valid for list of user selected IP addresses.

  - description, 19
- frequency analyser, 91
- frequency configuration tables, 96
- frequency TX, 111
- Fresnel zone, 15
- function test
  - after installation, 61
  - before installation, 33

## G

- grounding, 53

## H

- help, 62
- https access, 28

## I

- installation, 20
  - polarization, 19, 36

## K

- keys
  - feature, 24, 32, 94
  - ssh access, 173
  - ssh conversion, 172

## L

- LED, 22
- licensing, 159
- link
  - configuration, 32
  - length, 16
  - microwave, 8
- LLDP protocol, 78
- Lower, 19

## M

- microwave link, 8
- models, 20

## N

- name plate, 23

## O

- ordering codes, 24

## P

- parameters
  - basic, 8

- setup, 61
- table, 106
- polarization
  - cross, 36
  - indication, 66
  - mounting, 35

## Q

- QoS, 72

## R

- radio, 66
- rain zone, 167
- restart, 92
- rollback, 63, 101
- RSS indication, 58

## S

- safety, 159
- secured access, 78
- serial, 65
- service access, 28
- settings, 68
- setup
  - parameters, 61
- SSH access, 78, 100
- start, 6, 27
- start up, 57
- statistics, 67
- status
  - bar, 64
  - LED, 22
  - menu, 65

## T

- tables
  - frequencies, 111, 116
  - power, 112
  - radio parameters, 113
  - RAy11 A,B, 112
  - RAy11 C,D, 127
  - RAy17, 133
  - RAy24, 143
  - speeds, 108
  - technical parameters, 106
- time, 68
- tool set, 26
- tools, 88
- trademark, 5
- transfer speed, 66
- troubleshooting, 105

## U

- Upper, 19

## Appendix F. Revision History

Revision 1.0	2013-06-14
First issue	
Revision 1.1	2013-06-14
Added - List of documentation	
Revision 1.2	2013-08-13
Declaration of Conformity correction	
Revision 2.0	2013-08-28
Merged with the Volume 2 - Frequency and Modulation Tables	
Revision 2.1	2013-10-25
User data rate correction, RAY11 for 7 MHz / 256QAM	
Revision 2.2	2013-10-30
Signal polarization	
Revision 3.0	2013-11-05
Extended to the RAY24	
Revision 3.1	2013-12-20
RAY11-C,D channels correction	
Revision 3.2	2014-01-10
Frame rate according to RFC 2544, added	
Frequency table for Bandwidth 30 MHz, added	
Revision 3.3	2014-03-28
Link speed for CS 28/30 MHz ACAP, 256-QAM corrected	
Country of Origin Declaration added	
Jirous antenna dimensions
